THE Dublin police maintain that they are on the track of the murderers of Lord Cavendish and Under Secretary Burke, and appear sanguine of effecting their arrest.

THE School Directors at Nevada City recently refused to admit four Chinese pupils to the public school, and now the lawyers of that city are preparing to make a test case of it.

CREMATION has established a firm foothold in Italy. At a convention just held in Modena there were representatives of twenty-seven cremation socities established in different Italian cities.

THE general condition of English financial affairs is now tolerably good, the only disturbing element coming from the New York stock market, and as a consequence, American railway stocks are shunned.

HERMAN ALLEN died at Whitehall, N. Y., recently after a peculiar illness, lasting 12 years. He appeared to have dropsy, and was insane at times. A post mortem disclosed that his liver had entirely wasted away.

RUSSIA has concluded a new loan for $40,000,000, which brings up the total of her outstanding debt to $2,765,000,000. What is most noteworthy is the fact that her debt has almost doubled since 1872, the annual deficit in her finances averaging $120,000,000, whereas 20 years previous it was only $55,000,000.

A MERCHANT of Chicago, Saturday night, awakened by the ringing of his telephone bell, proceeded to his store with which the telephone was connected, where he found burglars at work. He exchanged shots with them and drove them off. It was found that they had blown open the safe, the detonation having caused the telephone to ring.

Recent Contributions to the California State Mining Bureau.

[Furnished for publication in the MINING AND SCIENTIFIC PRESS by HENRY G. HANKS, State Mineralogist.]

[CATALOGUE.]

4332. Curious Concretions, not determined; thought to be Coprolites—Near Pine Grove, Amador county, Cal. S. W. Collins.
4333. Silver Ore—Sommer's Kentucky mine, Sweetwater mountains, Esmeralda county, Nev.; 1,150 ft. elevation. J. F. Johnson.
4334. Rock Specimen; so-called porphyry; found associated with No. 4333—Sweetwater mountains, Esmeralda county, Nev. J. F. Johnson.
4335. Actinolite—Santa Rosa, Sonoma county, Cal. A. W. Dana.
4336. Mountain Leather, Amphibol—Little Grass Valley mine, Pine Grove district, Amador county, Cal. S. W. Collins.
4337. Impure Pyrolusite—St. Helena mountain, Napa county Cal. M. Skinner.
4338. Cubical Pyrites—Knox & Osborn mine, Calaveras county, Cal. See No. 2326. Knox & Osborn.
4339. Actinolite—Spanish Ranch, Plumas county, Cal. Mrs. A. Keep.
4340. Rock Resembling Halefinta—Spanish Ranch, Plumas county, Cal. Col. Albert Keep.
4341. Breccia of Red Jasper in White Quartz—Glennbrook, Lake county, Cal. H. A. Aldrich.
4342. Fine Sedimentary Silt, blue of Idaho and Montana, on N. P. R. R., 20 or 30 miles southeast of Pen de Oreille lake. A. W. Dana.
4343. Stigmaria Ficoides (Lesq.), Fossil Plant, Mason Creek, Ill. J. Z. Davis.
4344. Magnetite, Magnetic Iron Ore—San Benito county, Cal., 14 miles from Hollister, sections 31 and 6, township 15 south, range 6 east, San Benito iron mine; occurs in large quantities with limestone. Charles Sellers.
4345. Apatite Crystal.—Renfew county, Ontario, Canada. D. R. Mackillican.
4346. Apatite; massive; used largely as a fertilizer—Ottawa county, Quebec, Canada. D. R. Mackillican.
4347. Menaccanite Crystals—Renfew county, Ontario, Canada. D. R. Mackillican.
4348. Zircon—Renfew county, Ontario, Canada. D. R. Mackillican.
4349. Quicksilver Ore with Chalcedony and Stibnite, sulphide of antimony—Lake quicksilver mine, Lake county, Cal. This mine joins the Manhattan, a well-known quicksilver mine, and is from a depth of 6 ft. Knox & Osborn. This specimen is interesting as showing the association of antimony and mercury, which is common not only in California, but in other localities.
4350. Garnets—San Borxas, Lower California, Mexico. J. G. Moraga.
4351. Copper Ore—Beverage district, Inyo county, Cal. T. Dimough.
4352. Amarillo Wood—Piece of a timber which was 12 ft. through, found at a depth of 23 ft. from one of the lost mines of Cana, Isthmus of Darien, 90 miles south of Panama. 40 miles in the interior. Work was commenced on these mines in 1858. They were abandoned in 1772, owing to a cave, which is reported to have buried a large number of miners. It was examined for reopening, in 1880, by Mr. James H. Crossman, who presents this relic to the Mining Bureau. The whole of the piece from which this was taken was in a good state of preservation when found by Mr. Crossman in 1880.
4353. Fossil Bone—Taken from a cliff 100 ft. from the surface and 10 ft. above the old Pescadero, San Mateo county, Cal. J. Z. Davis. There are 62 distinct strata above where it was found. The locality is two miles west of the town.
4354. Antimony Ore, 3 pounds, said to contain gold—Near Kernville, Kern county, Cal. Dr. S. G. George.
4355. Cinnabar and Calcite—Old Napa Con. Q. M. Co., Pope valley, Napa county, Cal. Joseph Osborn.
4356. Hematite—Diamond Springs Township, El Dorado county, Cal. N. D. Buckingham. The following information is furnished with the specimen: One thousand tons shipped to San Francisco several years ago; was used in the manufacture of iron. The ledge is 60 ft. wide; a ledge of marble runs parallel and some distance to the east, say 100 ft. The block of marble which California sent to the Washington monument came from this ledge. A tunnel is driven in about 120 ft., which cuts the ledge 60 ft. below the surface. At another point they have sunk a shaft about 40 ft., all in ore. Plenty of wood for charcoal. Water costs five cents per inch. Charcoal is now worth 15 cents, could be furnished for eight cents per bushel.
4357. Pyrite Ore, auriferous—Meadow Lake district, Nevada county, Cal. U. S. Grant mine. J. B. Griffin.
4358. Copper Ores—Chile. F. Casanueva.
4359. Calcareous Tufa—Near the Carbon River Coal mines, Washington Territory.
4360. Turquois—New Mexico. S. Heydenfeldt, Jr.
4361. Satin Spar, gypsum—San Bernardino county, Cal. H. G. Maynard.
4362. Auriferous Quartz—Baltimore mine, near Kelsey's, El Dorado county, Cal. Charles J. Pilsbury.
4363. Turritella Humboldtii (Von Buch), cretaceous fossil, Atacama, Chile.
4364. Gold Quartz—Mark Twain mine, Angel's Camp, Calaveras county. Cal. Croppings, very rich in gold. A. M. Alexander.
4365. Molybdenite, Sulphide of Molybdenum; mistaken for Graphite—Inyo county, Cal. S. D. Woodhull.
4366. Mispickel, Arsenical Pyrites; rich in gold—Belmont, Nye county, Nevada. Geo. W. Emerson.
4367. Cryolite with Chalybite, Carbonate of Iron—Greenland. A. H. Fracker.
4368. Serpulorbis Squamigerus (Cpr.), recent shell—Santa Barbara, Cal. J. Z. Davis.
4369. Asbestus Containing Gold (Lundagai)—New South Wales. P. Davies.
4370. Stream Bismuth—Ethridge River, Queensland, Australia. P. Davies.
4371. Alluvial Gold from South Lead Gold mining company's mines—Forbes, New South Wales. From a depth of 200 ft. Formation, Tertiary drift; bedrock beneath the gravels, Lower Silurian slates, with belts of intrusive Diorite. P. Davies.
4372. Zircons, Rubies, and other minerals—New Cham Hill hydraulic mine, Kiandra, Australia, 5,000 ft. above the sea. P. Davies.
4374. Pebbles found in Auriferous Wash—South Lead, Forbes New South Wales. P. Davies.
4375. Auriferous Pyrites—Excelsior mine, Meadow Lake district, Nevada county, Cal. H. H. Hartley.

Mining and Scientific Press.

THE MINING AND SCIENTIFIC PRESS is the leading mining journal in America, and enjoys a larger circulation among the more intelligent operators and workers in the gold fields of the world.

Established in 1860, it has firmly maintained its position as a reliable, progressive journal. The information given in its columns has saved millions of dollars to the practical miners, metallurgists, mill men, mine and shareholders on the Western side of our continent.

Among its contributors are the ablest and most experienced mining engineers, superintendents and practical miners in this country.

The PRESS gives a condensed summary of Mining News from the most important mining districts of the country.

New processes and methods of mining are described in its weekly issues. New mining machinery and improvements are frequently illustrated and explained in a manner to be of great value to all interested in mining.

As a scientific and mechanical representative of the Pacific coast it is decidedly popular, and a standard journal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere unrivalled.

Every public library, mining engineer, metallurgist, mining operator and intelligent mechanic and manufacturer, will find profit by its reading.

Subscription, $4 a year in advance. Sample copies postpaid, 10 cents.

A Curious Spring.

EDITORS PRESS:—While stopping at Elko I was told that a great curiosity existed within one and one-half miles of the town, consisting of a string, the water of which tasted like "chicken soup." Nothing loth to see anything pertaining to the marvellous, I got aboard the little stage which makes the trip every hour for the benefit of the traveling public and the citizens of the town who wish to try the fine bathing facilities with which the place is furnished, and we soon arrived at a commodious and neatly kept hotel, through which I was shown by the proprietress, Mrs. J. J. Garrecht. The house is furnished with bath-rooms, which are supplied with hot water by pipes from the spring on the hillside above. In another building near by there is a fine plunge bath large enough for swimming in. After looking at the various conveniences of the place I was asked to go to the spring and try the so-called "chicken soup." My attendant obtained a supply of pepper and salt and a large beer glass. On our arrival at the spring the water was dipped up and allowed to cool, when the pepper and salt were added, making a drink that would tickle the palate of an epicure, and very much resembling the soup aforementioned, though really much better than that usually served on the tables of the average boarding-house.

The water of the spring is very clear and boils up at intervals of about two minutes, ejecting a cloud of steam. It is very hot, and an egg is boiled in a very short time. The water contains sulphur, iron and magnesia. A short distance from here is another spring of the same character, though situated in a perfect crater, the walls of which are about 15 ft. high, forming quite a pool, 20 ft. in width. A great many invalids have visited the place and been benefited, particularly men who have been leaded or salivated from working around the smelting-furnaces. W.

Concentrators and Sulphurets.

Hitherto it has not paid miners to concentrate the sulphurets in their ores, unless the concentrations were very rich. And, even rich concentrations have scarcely paid for working by chlorination, owing to the high cost of acid, and consequent high price of chlorination.

Miners and prospectors will, therefore, be pleased to hear that their sulphurets, even though not high grade, promise to be a source of profit in the immediate future.

Mr. A. B. Watt, having had long experience in Europe and the Eastern States in working this class of ores, has concluded to establish reduction works in or near San Francisco—provided a sufficient supply of clean sulphurets can be obtained.

By his process the expense of roasting is saved, and the gold concentrated into a small bulk by a simple and inexpensive melting process.

Miners will do well to address him—sending small samples of their concentrations by mail. (The merchandise mail takes samples under four pounds in weight for one cent per ounce.)

If he finds our miners disposed to deal liberally with him, a new enterprise will at once be established here, which will increase the profits of the mines and render profitable many properties now lying idle for want of just such an establishment as he contemplates.

He asks nothing from our miners but the assurance that they will keep him supplied with ore. We hope every one who can furnish a ton of concentrations monthly will respond to his invitation to come forward. His address may be found in our advertising columns.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men

G. W. MCGREW—Santa Clara county.
M. P. OWEN—Santa Cruz county.
J. W. A. WRIGHT—Merced, Tulare and Kern counties.
JAMES C. HOAG—California.
L. L. WOODMANSEE—Nevada State.
B. W. CROWELL—Los Angeles county.
L. WALKER—Butte, Tehama and Shasta counties.
E. A. WILLIAMS—San Francisco.
S. E. BAKER—Eastern States.
J. WILTSE, Amador county.

Agents Now Wanted.

Extra inducements will be offered for a few active canvassers, who will give their whole attention (for a while at least) to our business. Apply soon, or address this office, giving address, age, experience and reference.

DEWEY & CO., Publishers,
No. 252 Market St., S. F.

Extra Type For Sale.

We offer Scotch brevier type, (same as used on this paper) for sale in any quantity from 100 lbs. to 1,000 lbs., for 25 cents per lb., if ordered soon. Also, several hundred pounds of nonpareil at favorable rates. The type is in good condition and is of a very durable character.

DEWEY & CO.

To Engineers and Draftsmen.

WANTED.—A good wood engraver. Also, a draftsman, who can make pen and ink drawing on paper or stone. Apply at this office.

Old Papers Wanted.

Twenty cents each will be paid for a limited number of copies of any of the following Nos. of the MINING AND SCIENTIFIC PRESS, if received soon at this office: No. 1, of Vol. 13, 1866; No. 5, Vol. 18, 1869; Nos. 1 and 26, of Vol. 20, 1870; No. 1, of Vol. 22, 1871. Also, 10 cents per copy for Nos. 2, 3, 4, 7, 10, 11, 12, 13 and 15, of Vol. 30, 1875. If any one who has files of back volumes of the PRESS, which they may like to dispose of at a moderate rate, will send us a memorandum of the same and the price, we may be able, sooner or later, to assist in their disposal.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

REMITTANCES to this office should be made by postal order or registered letter, when practicable; cost of postal order, for $15 or less, 10 cts.; for registered letter, in addition to regular postage (at 3 cts. per half-ounce), 10 cts

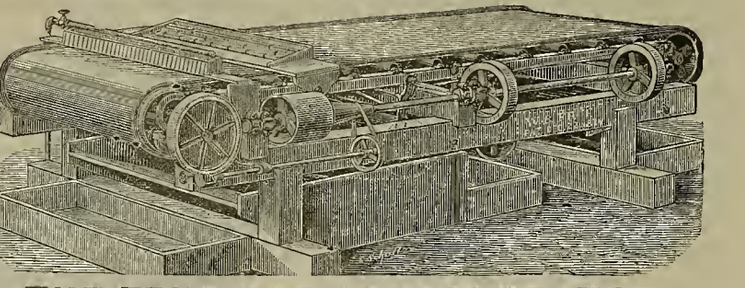
SULPHURETS.

Clean Concentrations wanted. A party from the East having a process for working low-grade Sulphurets, will commence purchasing the same as soon as assured of an abundant supply. Gold-bearing Sulphurets preferred, having an assay value of $20 per ton, or upwards. Address,

A. B. WATT, P. O. Box, 2293, San Francisco.

This paper is printed with Ink Manufactured by Charles Eneu Johnson & Co., 509 South 10th St., Philadelphia. Branch Offices—47 Rose St., New York, and 40 La Salle St., Chicago. Agent for the Pacific Coast—Joseph H. Dorety, 529 Commercial St., S. F.

$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR,

—OR—

VANNING MACHINE.

Over 400 are now in use, giving entire satisfaction. Saves from 40 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal.

A machine can be seen in working order, and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont Street.

To those intending to manufacture or purchase the so-called "Triumph" Concentrator, we herewith state:

That legal advice has been given that *all shaking motion* applied to an *endless traveling* belt used for concentration of ores is an infringement on patents held and owned by the Frue Vanning Machine Company.

That suit has been commenced in New York against an end-shake machine similar to the Triumph, and that as soon as decision is reached in the courts there, proceedings will be taken against all Western infringements.

That the patent laws make users of infringements responsible as well as makers, and the public is therefore warned that there is considerable risk in purchasing any end-shake machine until our various patents have been decided.

That if there are those who for any reason prefer an end-shake machine, we can manufacture and sell to such a machine of that description, as efficient as the Triumph, and at a lower price, and no liability for infringement will then be incurred by the purchaser.

That we shall protect ourselves against any one making, selling or using any machine infringing any of our patents. Patented July 9, 1867; May 4, 1869; Dec. 22, 1874; Sept. 2, 1879; April 27, 1880. Patents applied for.

That we are, and have been, ready at any time, to make a competitive trial against the Triumph, or any other machine, for stakes of $1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Company,

Room 7, 109 California Street, - - - - SAN FRANCISCO, CAL.
Nov. 6, 1882.

"THE $1,000 CHALLENGE"

Ore Feeder for Quartz Mills.

OVER 800 ARE NOW IN USE, GIVING ENTIRE SATISFACTION.

Awarded First Premium at the Tenth and Twelfth Industrial Fairs of the Mechanics' Institute.

Twenty Per Cent. More Ore Crushed with Fifteen Per Cent. Less Wear of Iron than by Hand Feeding.

The accompanying cut illustrates the recently introduced Grip, and also the Spring Attachment, which replaces the Weight heretofore used, and which are obvious improvements.

It is now fully demonstrated, after careful and long continued experimentation and practical use, that the plan upon which a perfect Ore Feeder must be constructed is that of a carrier, and not that of a shaking table Uniform and accurate feeding is not possible upon the latter plan. The ore must be evenly carried, upon a steadily advancing plane or table, to the line of discharge, and there simply dropped. Jerky or spasmodic contrivances will not answer the purpose for wet or sticky ores

The Challenge Ore Feeders are now in Use in the following Mills, besides many others

Superiority of the "Challenge" Ore Feeder Demonstrated!

At the "Christy" Mill, Uintah County, Utah, the "Eclipse" Feeders, (conceived by E. Coleman) were introduced, but not carrying a regular supply of ore for the crushing capacity of the stamps, were replaced by the "Challenge," which are now running and the stamps crushing forty (40) per cent. more ore than was done by the "eclipse."

The "Harshaw" or "Hermosa" Mill, of Patagonia District, Arizona, was also originally fitted with "Eclipse" Feeders, but after a few weeks trial they were pronounced inadequate to the work, discarded, and the "Challenge" adopted.

The "Silver King" Mill of Arizona, also removed the 'Eclipse" Feeders to give place to the "Challenge."

The "Sola" Mill, of Brown's Valley, Yuba County, Cal., was fitted with "Victor" Feeders, manufactured by E. T. Steen, but proving insufficient, the "Challenge" Feeders were substituted.

Four of the "Victor" Feeders, manufactured by E. T Steen, were also placed in the "Alexander" Mill, at Grantsville, Nevada, but after a fair trial were discarded, and Hendy's Feeders fitted, and four others of the same pattern added when the second twenty stamps were erected.

These cases are simply cited from among many similar instances, in proof of the vast superiority of the "Challenge" Feeders over all others.

JOSHUA HENDY, Agent,

MACHINE WORKS

210 and 212 Beale Street, bet. Howard and Folsom Sts., - - San Francisco.

Manufacturer of

IMPROVED PORTABLE HOISTING ENGINES,

FOR MINING AND OTHER PURPOSES.

Also of the HAWKINS' PATENT ELEVATOR HOIST, for Hotels, Warehouses and Public Buildings.

Steam Engines and all Kinds of Mill and Mining Machinery.

Colorado Iron Works,

MANUFACTURERS OF

ENGINES, BOILERS, RAILWAY CAST AND WROUGHT WORK, BRIDGE WORK, BOLTS AND BOLT ENDS, BUILDING WORK, ETC.

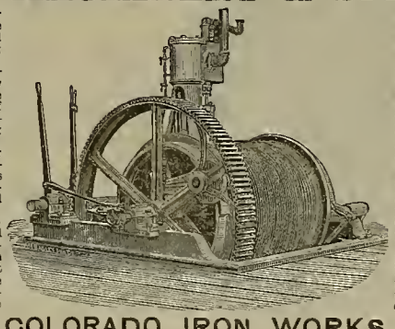
MINING MACHINERY A SPECIALTY.

Our manufactures of mining machinery embrace every kind of machine and appliance for the mining and reduction of ores.

We have had an experience of more than twenty years in the manufacture and practical operation of mining machinery in Colorado and the neighboring States and Territories.

Our facilities are superior to those of any manufactory in the West, our works having been recently rebuilt, greatly enlarged and completely equipped.

We invite the investigation of mine owners and mill men seeking machinery. We can furnish, on board, at our works, or set up at the mines anywhere in the Rocky Mountain region, on short notice, the following machinery: Cornish Pumps, Steam Pumps, Stamp Mills for Wet or Dry crushing, Pans, Settlers, Agitators, Retorts, Bullion and Ingot Moulds, Reverberatory Furnaces, Bruckner Cylinders, Revolving Roasting Furnaces and Dryers, Melting Furnaces, Concentrating Machinery, Rolls, Crushers, Conveyors and Elevators, Ore Samplers and Grinders, Hoisting Engines, Water Jacket Furnaces, Slag Pots and Cars, Lead Pots and Ladles, Blast Pipes and Water Tuyeres, Blowers, Cupellation Furnaces, Market Kettles, Wire Rope, Cages, Buckets, Skips, Ore Cars, etc. Estimates furnished and prices quoted on application. Send for illustrated catalogue.



COLORADO IRON WORKS,

P. O. Box, 1921, - - - - Denver, Colorado.

STEEL CASTINGS

FROM 1-4 TO 10,000 lbs. WEIGHT.

True to pattern, sound and solid, of unequaled strength, toughness and durability.

An invaluable substitute for forgings or cast-iron requiring three-fold strength.

Gearing of all kinds, Shoes, Dies, Hammerheads, Crossheads for Locomotives, etc.

15,000 Crank Shafts and 10,000 Gear Wheels of this Steel now running prove its superiority over other Steel Castings.

CRANK SHAFTS, SHOES, DIES and GEARING specialties.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers. SAN FRANCISCO, SATURDAY, DECEMBER 9, 1882. VOLUME XLV Number 24

Notes From Eureka.

[From our regular Correspondent.]

EDITORS PRESS:—There has been a great deal of talk lately about what the advantages of good wagon roads on both the east and west sides of Prospect mountain in this district might be to the mine owners of the locality. Proper inquiries will be made in reference thereto, plans will be submitted, and estimates of cost will be brought forward.

It is doubtful, however, whether the county of Eureka will be in a condition to furnish the funds necessary to build such roads for at least a year from the present date, but private capital might be used for the purpose, with a reasonable assurance that fair profits would result from the investment. It is well known that there are large

Deposits of Low Grade Ore

Existing in Prospect mountain at various points which, at present rates of transportation (by mule pack trains over circuitous trails) and reduction, it will not pay to extract, but which, with these expenses lessened, can be made to pay the cost of mining, hauling and reduction, and leave a profit to the owners. By building the roads in question the cost of hauling could be reduced $2 to $3 50 per ton.

The cost of reducing ore by the smelting process has been materially lessened during the past three years, and the Geddes Co., at Secret canyon, have practically proved that our milling ores can be

Reduced by the Leaching Process

At 25% less than it costs to smelt the same. Here is a splendid field for investment, and an excellent chance to secure profitable returns. Capitalists may come to Eureka and find that mining pays, as beyond doubt it does when operations are conducted with judgment and economy.

Since the Geddes mill was supposed to be completed several alterations have been needed and some changes made, but I am now assured that the company are chloridizing up to a very high percentage, and the leaching process has proved successful. The silver is taken out of the tubs in a sulphide form, and reduced by cupellation at the Richmond refinery. The bullion is said to be 975 fine. It costs about $9 per ton to put the ore through, and all that assays $15 a ton can be worked at a profit.

There are immense masses of low-grade ore in the Geddes mine, and much that is high-grade. At present the low-grade ore is being cleaned up all through the mine, but more especially where the richer ore has already been taken from it.

The Richmond company have 16 men employed at the Hoosac mine, on Hoosac mountain, who take out a little ore from time to time, but not with regularity.

The Monumental tunnel, in Prospect mountain, is in about 300 ft., with the ground very hard, but prospects improving. The surface ground is owned by the Monumental Tunnel and Mining Co., and as there is a good showing of ore in the croppings, there is no reason to doubt that the mine will some day be a productive and paying property.

The Lena and Compass locations, on Prospect mountain, are being developed by means of a tunnel commencing at the north end of the Lena, from which a cross-cut will shortly be run to the Compass. The Lena has also been opened by a shaft down 72 ft., at which point there is a body of iron 15 ft. in thickness, and a seam of ore 4 inches thick that assays $72 per ton.

The Williams mine, on the west side of Prospect mountain, a property that, in the hands of poor men, has already yielded over $100,000 in gold and silver ore, will probably pass into the hands of an English syndicate at no distant day.

Developments are Steadily Progressing

At the Uncle Sam Con., situated between the Dunderburg and Hamburg mines. A quantity of very rich ore was taken from near the surface a few years ago, at a point just above New York canyon, south of the main traveled road, but the work on it was discontinued. A new shaft was subsequently sunk near the center of the claim, and a drift run eastward 40 ft. from the surface, without any satisfactory results. The shaft was then sunk to a depth of 95 ft., and another drift run westerly 160 ft. into the hill, where very hard rock was encountered. A drift is now being driven northward from the bottom of the shaft in broken limestone, and the prospects for finding ore are exceedingly good. There are other places in this mine where heavy lead ore has been found in fair quantities.

A telephone exchange is to be opened in a few days, with connections to many of our leading mines. The lines are now being run out to

The Eureka Tunnel,

Which continues to look well, and is producing about the same as when I last reported to you. The present ore body is 120 ft. from the main shaft and 1,100 ft. westerly from the entrance to the tunnel on the 105 level. It was followed 80 ft. in a southerly direction, where it became capped with limestone, and seemingly ended. From the north end of the seam it has been followed 200 ft., with a gradual upward tendency for three-fourths of the distance, bringing it 45 ft. nearer to the tunnel level at the latter point. Fifty feet further north to the face of stope the vein has a stronger dip, and seems to improve in quality and quantity. The average thickness is about two feet. A new strike has been made in a drift running north from the winze from the south drift. It is in appearance similar to the first ore body struck in the tunnel, but I have not yet learned how much it assays. New air connections are needed in the mine. Gen. P. E. Conner will shortly go to San Francisco to purchase an air compressor and an engine to be used at the main shaft in the tunnel.

Work has been abandoned for the present in the El Dorado Con., on account of bad air, but a contract was let to-day to run the south drift from the Eureka tunnel to connect with the El Dorado No. 2 main shaft, which, when done, will give a splendid ventilation to both mines.

At the Silver State mine a crosscut is being driven from the tunnel on a seam of ore, and good results are confidently expected.

The Boston and Eureka Co., on Adams' Hill, north, have resumed work and commenced drifting on the 200 level on the ledge. There is seven feet of low-grade ore in sight at this point, and the prospects on this property are very flattering.

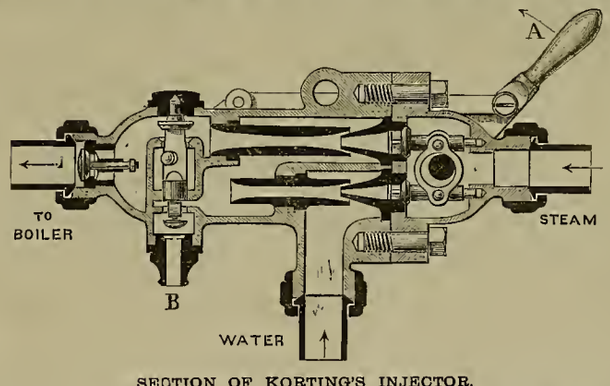
The big tubes of the fume arresters for the Albion furnaces will reach Eureka to-morrow night, and when they are placed in position a full blast may be applied to the furnaces, and better results than ever may be attained. I hope in my next to give you a graphic description of the Albion works. Yours truly,

M. H. JOSEPH.

Eureka, Nev., Dec. 4, 1882.

COPPER.—The price of copper keeps up well. As to the state of the market in England, the London *Mining Journal* says: "We have, therefore, an evidence of a good trade having been done in the past month, and there seems no reason to suppose that in the future business is likely to fall off; and then, with regard to prices, of course a good deal will depend on the action of operators, but as the weak holders gradually rid themselves of their stocks there is less likelihood of a pressure of sales, and although to a great extent prices will doubtless be regulated by monetary and other events, yet they will also, in a great measure, be guided by future statistics, and the light charters which were advised on Monday for the latter half of October bid well for the ensuing statistics to be favorable. The quantity advised was 1,250 tons, all bars and ingots, of which 350 tons only were for England, and 900 tons for the continent. There is consequently a tolerably light charter to commence the month with, while another feature in the market is also fair deliveries for the first part of October, those of Chili produce in Liverpool and Swansea being 1,414 tons, and the other kinds 602 tons, the imports for the same time being 888 tons, and 1,313 tons respectively. The stock of Chili produce on the 31st ult. was 22,679 tons, against 23,205 tons on the 14th ult. The total visible stock on the 31st ult. was reduced to 46,809 tons, against 46,945 tons on Sept. 30 last, and 53,812 tons on Oct. 1, 1881, and 62,543 tons on Oct. 31, 1880."

THE UNIVERSAL INJECTOR.



SECTION OF KORTING'S INJECTOR.

ROCK SALT DEPOSITS.—In answer to a correspondent it may be stated that the Commissioner of the General Land Office has decided that ledges of rock salt found upon the public domain are subject to occupation and sale under the provisions of the Mining Act, and locations of such ledges carry with them every incident of possessory title conferred by said Act.

The Universal Injector.

The engravings on this page illustrate Korting's Universal Injector, for which H. P. Gregory & Co. of this city are agents. As will be observed, the instrument is a combination of two steam jet apparatus; the first one proportioned for lifting and delivering the water under some pressure into the second one, where its velocity is sufficiently augmented to overcome the counter pressure of the boiler. The explanation of the proper working of the Injector, at the lowest as well as the highest steam pressures, without any adjustment of parts, is found in the fact that the quantity of the water taken in by the first apparatus and delivered to the second one is directly in proportion to the pressure of the steam, so that the first one acts as a governor for the second one.

The explanation of the feeding of hot as well as cold water is found in the construction and proportion of the first apparatus, which has a proportionately small steam nozzle to insure high suction, and as the water is delivered to the second one under pressure, its temperature can be corresponding to this pressure, and may be delivered into the boiler above the boiling point. At the same time the combined area of the two steam nozzles is smaller than that of any other injector of the same capacity, so that its duty must necessarily be higher.

This combination of the two apparatus, and its self-governing qualities without moving parts, makes the apparatus the least sensitive—a great desideratum on locomotives. The limits of admissible temperature are: Feedwater, 150° Fahr., delivered into the boiler, with 150 lbs. steam at 250 Fahr. Injectors will lift water up to 20 ft., according to temperature. During working hours the stop valve, *B*, on the boiler, which may be any kind of a valve, remains turned on, and the stopping and starting is solely effected by the lever *A* operating the valves in the steam chamber of the injector. To start the injector the handle is moved forward; to stop it is moved back. Right and left-handed machines are made. This injector is claimed to be the best in the market. It works with high or low pressure steam; hot or cold water; water under pressure or suction, without any adjustment, and no waste of water or overflow.

COMPRESSED LIME BLASTING.—A highly successful series of experiments have taken place in Belgium, under the superintendence of Major Paget Mosley (one of the proprietors of the system), in conjunction with M. Paul d'Andrimont, of the Hasard collieries, near Liege, the results of which not only demonstrated the safety which the "compressed lime" system affords, but also gave a very great increase in the proportion of large coal obtained by its use as compared with powder. At one of the trials the Inspector-General of Belgium Mines and other Government officials were present, as well as owners and managers of several collieries in the district, all of whom expressed a high opinion of the system. Arrangements have been concluded for its adoption in Belgium, and trials are about to commence in the German and Austrian coal fields.

FLOWERS IN THE DEPTHS.—A botanical and geological curiosity exists on the 550-foot level of the Phenix mine. A miner informs us that among a pile of loose rocks on that level a beautiful flower has sprung into existence, which is now some four inches high and in full bloom. The peculiarity of this singular visitor, which appears to greet the miners on their passage to and from work with a perfumed smile, is, that four tiny stems support it, which come together directly under the flower, which is of a grayish blue and in the shape of a buttercup. It has been fresh and vigorous for a week past, and from appearances will soon have some others to keep it company, as several green blades are peeping up through the crevices.—Eureka (Nev.) *Sentinel*.

INCREASED SURFACE FOR PATENTED GROUND.—The Commissioner of the General Land Office has decided that a mining claim already patented cannot be made the basis of an application for patent—for additional surface ground or otherwise—nor can surface ground be claimed on account of a lode owned by other parties.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

Mineral Park, Arizona.

(From our Correspondent.)

EDITORS PRESS:—On acconnt of irregularities in our mails I deferred writing—I believe one issue. We are supposed to have a tri-weekly mail, bnt it *tries* to get around about once in two months, so we call it try-monthly; but I now write you a continuation of the minee in Wallipai district. Commencing in Tod Basin, there are several very promising ledges in this vicinity, among which are the Pennsylvania, Monogram, Prosperity and Primrose, which belong to Capt. Lans, an old Nevada minar, who is working hard to develop them. 'Tis true there are no mines here, but there are no better prospects in any country. I will say here that the prospects, all of thom, helong to poor men. The above ledges are now producing ore wbich will go up in the hundreds. The Tod mine, from which the hasin takes its name, is another large and well defined vsin. It belongs to the Hon. A. E. Davis, who is negotiating with partiss to put a mill on the seme. Then there's the Silver, Oro and Mastodon, all large veins and well dafined. The Oro Plato is another large and well defined vein. It has a drift run on vein over 200 ft. in length, and in the face it has two feet of ore which assays $146 silver and $156 in gold. It belonge to Welton & Grounde of this place, who now have a force of men working it and piling the ore on the dump, waiting the advent of the A. & P. R. R., when they expect to ship it where they can get the best rsturns—to Colorado or San Francisco. The Meriposa is another splendid prospect, and hslongs to the same parties; then oomes ths Nightingale, which is a promising prospect, and belongs to O'Brien & Lane. In another basin called Bohtail hasin are several line veins, among which is the Cordelia, Standard and Chester.

In the vicinity of Mineral Park are several well-dafined veins, among which are the Keystone, Lone Star, Fairfield, Setting Sun, Mstallic Accidant, Quick Relief, Snrprise, Woodchopper's Relief, Nsllie and several others—in fact, too numerous to give even a hrief deecription of ths Keystone property, helonging to a New York party, which hae got one of those litigant plasters on it, which has held it in suspense for years, and lieble to for some time to come; but the ground is patented, and the partiee think it makes no differenca if they never work it. The Lone Star is a strong vein, carrying considerable native silver; in fact, the silver is a series of network and bunches of wire—the most beautiful I ever saw. Welton & Grounds, the owners, have now a force of men on it. The Fairfield is the west extension of the Keystone. On it there is a shaft ahout 200 ft. deep, with a tunnel run in about 1,300 ft. to connect with shaft. As yet, they have not connected, and I don't think they ever will. It ie one of the most ridiculous ideas of min'ng imaginable. It helongs to a New York company, and is now a subject of litigation; and no wonder such mining as that injures the country. The Setting Sun is a largs, wsll-defined vein. The Metallic Accidout is another fine piece of property—a large vein and well defined. T. J. Christie, who firet diecovered it, took off the surfacs $36,000, a pretty good home-stake itself. The partiee who now own it are running a tnnnel to cut the ledge at a depth of about 250 ft. The Quick Relief ie a large vein, and ie showing up nicely. It helonge to a New York company, who have a force of men on it einking their shaft deeper. A sample of the ore from the bottom acsayed $350 in eilver per ton. The Surprise is the west extension of Quick Relief, with a ehaft on it ahout 100 ft. deep, and it looks firet rate. The Nellie ie a large and well-defined vein iu the same belt as the othere. It helonge to R. C. Frazier, of Cheyenne, who ie preparing to put a force ol men to work to develop it. It wae one of the mines which was repreeented at the Denver Exposition. I will say in connection that there were eimply five mines from Mohave county represented at the Denver Exposition, ehowing a lack of interest to represent the county. The Wood Chopper'e Rslief ie another large and well-defined vein. It derived its name from an old man who found it while he wae chopping wood. There is a ehaft eunk 50 ft., and a tnnnel run on ledge 135 ft. in length. At present, in face of drift, the ledge is 4½ ft. wide, which aseaye, from sample taken, 65 ozs. in eilver and 30% lead. The ore from thie mine is a eoft iron ore of low grade, interepersed with large rich kidneys, which ore hae worked $262 per ton. Yours, W. H.

Mineral Park, Wallipai mining dietrict, Mohave county, Arizona.

BISBEE.—As previously reported, water has been etruck at 85 ft. in the Copperopolie. Pumpe have been ordered from San Francieco, but in the meantime croescuts will be commenced in a eouth-eaeterly direction.

THE 37 quartz mille of Nevada county, Cal., orushed 1,110,000 tons of quartz during the laet official year.

Centrifugal Ventilators for Mines.

On this coast the only large centrifugal mechanical ventilator for minee in nse is the Guibal fan. It was put on the Comstock some years ago, and is in nse in other places as well. There are other ventilators of similar character; but it seems difficult, even where all are at work, to decide which is the best. Mr. C. M. Perry, in an elaborate paper on the Mechanical Ventilation of Collieries, from which we have before quoted, thus sums up the arguments concerning the centrifugal ventilatore, which we recently illuetrated:

The poiut arises—here are three centrifugal ventilators, all largely adopted, and all constructed on different principles—which is right and which is wrong? Each has its advocates, and probably the correct answer to the problem is: None of them are exactly right, and they all do good work. The Waddle ie correct in its curved pessages and its uniform areas, but is it right in the open running? Being quite exposed it is liable to he acted upon hy a strong breeze, which will not assist its free running, and no arrangement can well he made for easing the delivery, and the air rushing out at the circumference at a good speed wastes power hy the forces with which it has to etrike the atmosphere, and, being open all round, part of the delivery must he on the ground, and thie striking and rebounding will ceuse eddies in the fan.

Suppose an open running fan has a circumferential velocity of 6,000 ft. per minute=100 ft. per second, and discharges 240,000 cubic feet of air per minute. If the hlades are radial this air will leave the tipe of the hlades with this velocity, which represents an amonnt of stored up work sufficient to raise the whole mass of air to a hight of 156 ft. above the fan. Reckoning 13 cubic feet of air to one pound, we shall have 18,460 lbs. weight of air discharged each minute, posssssing work equal to raising it 156 ft.—$18,460 \times 156 \div 33,000 = 87$ horse power wanted in discharging the air at this velocity. The discharge of air at a greater velocity than is needed to raiee it to the required point above the fan is power wanted. In the Schiele and Guibal this hight is the hight of the chimney, hut in the Waddle there is no chimney, therefore the resultent velocity of the air should theoretically just he sufficient to enable the air to fall from the tips of the hlades. It is only fair to say that the North of England Institute place the Waddle fan very high on their list, as producing 52.79% useful effect—and not much better than this has ohtained in mine ventilation. The Schiele is correct in its small diameter and high velocity. There ie no mechanical difficulty in running a fan at 200 revolutions per minute, and by reducing the size the machine itself is lees ponderous, a less massive foundation is needed, and the whole affair occupies less space. The backward curvature of tho blades seems to be following in the correct lines as laid down for the centrifugal pumpe, and the narrowing the hlades towards the circumference, so as to give uniforn area of air pessages, ie unquestionably correct. As regards the spiral casing, thero has heen, and is great difference of opinion. Guibal tried the spiral casing, and ohtained unsatisfactory results. On the other hand, Mr. Cowper, ex-Presidant of ths mechanical engineers, said ths spiral casing ehould he the correct form, and in an exteneive esriee of experiments made with fans, he obtained the beet result, being ae high as 75%, with the epiral caeing. At the eeme time, however, Mr. Cowper etated that the fan with which he ob tained the beet reeulte had etraight radial bladee, which would eeem to show that the form of bladee ie after all not material. Mr. Cowper aleo thought it an unnecesaary expense to employ a large fan for ventilating a colliery, when the eame extent of ventilation could be ohtained at lese coet with a emall fan running at a high epeed, and he considered the emall fan would he equally applicable and equally economical in working. Mr. Bramwell, another ex-preeident, eaid the epiral form wae not only correct in theory, but it had been conclusively eetahliehed in practice ae the proper form; and curving the vanes forward at the outer extremity wae wrong, and would diminieh the reenlte obtained from the power expended in driving the fan. The Guihal fan at firet wae made with the casing cloeed all round the circumference, except at one point where the air wae allowed to he discharged, hut this wae found objectionable hecauee the air wae discharged at the high velocity of the circumference of the fan, and thue carried away an important store of force, and the partial utilization of thie force hae been effected by making the caeing of the ventilator terminate in an expanding chimney. By this plan, the air entering the hase of the chimney at a high velocity ie made to leave the top of the chimney at a reduced speed proportionate to the increased area of the outlet, and oonsequently a considerahle amount of power is thereby restored which would otherwiee be carried off. Thie expanding chimney ie an advantage, and ie poeseesed by the Schiele and Guihal in common.

The principle of thie expanding chimney ie important. In coneequence of it the air from the fan ie not paseed directly into the external atmosphere, hut hae ite velocity gradually reduced, the object being to minimize the loee of power. The aotion within this expanding chimney is that momentum is converted into pressure. The particles of air move more and more elowly, and finally encounter the inert atmosphere outside. Here they are crowded together, the space becomes more densely packed, and finally this reduced momentum terminates quietly in an increase of pressure. If the air rushed out uneided hy the expanding chimney, it would meet with much grsater resistance; it would set up eddies, and would be clogged in every direction, taxing the engine and requiring more power. The epiral caeing would seem to be a natural continuation of the expanding ohimney, inasmuch as the air can leave the fan at any point of the circumference, and makes its way through a gradually expanding pessage to the chimney, and then to the external atmosphere. Guihal also attached an adjustable shutter to regulate the eize of outlet from the ventilator, according to the various conditions of volume of air required and resistance to be overcome. Experiments were made to ehow the advantages derivable from the chimney and the shutter, and withont either chimney or shutter the percentage of useful effact was 31, with the chimney it rose to 57, and with the shutter it rose still farther to 61.

With regard to the two points in which the Guibal fan differe from the Schiele, namely in the concentric casing and the form of blades, Guibal argued, having first proved hy experiments that hie casing and hlades were right, that the more removed the casing is from the extremities of the vanes, the less proportion of the total air in ths casing is driven directly hy the vanes, and consequently the less effective result is ohtained from the centrifugal force. Then, as to the vanes, any hackward curvature of a vane tends to reduce the effect of centrifugal force in propelling the air, and might answer for an open-running fan, hut not one in which the air can only be delivered at one point. And in the Guibal fan a forward curvature of the extremity of the vanee ie adopted for ths purpose of correcting the injurious effect resulting from the inclination of the vanes backwards, the inclination hackwards from the radial line heiug designed to avoid the hlow that would be produced by the entering air upon the vane if the vane were placed radially.

Thue ends for the present our remarks as to centrifugal ventilators. It is not easy to decide as to ths respectivs merits of the three chief ventilators—namely, Waddle, Schiele and Guibal—the more especially as each perty can in the most conclusive mannar show, by experiments, that their fan is the best. Ths North of England Institute Committee, in their report, Decamber, 1881, do not render much assistance in deciding which is the hest ventilator, the Guibel varying from 40 to 52.95 useful effect, the Schiele from 46 12 to 49 27, and the Waddle, the only one of the kind that was tried, showing 52 79, whilst the Struve heads the list with 57.80, and Cook'e falle as low as 37 33. Sesing the difference in opinion amongst the most eminent engineers on the subject, for the writer even to attempt to decide would he another illustratinn of the adage that mortals "rush in where angele fear to tread." We have tried to present fairly opinions drawn from eminent authoritiss for and against, and leave the subject with our readers. They are all good mechanical ventilators, and have all proved themeelves capable of high, usefnl effect, and are all, as shown hy the large number working, deservadly esteemed.

Tapping a Subterranean Heat.

Several ecbemee have been propoeed for utilizing the internal heat of the earth; and eeeing that ae we deecend the temperature increasee at the rate of ahout one dsgree Fahr. for every 60 ft. or thereahout (thie rate varies greatly at different placee), the poesibility of doing eo is evident enough. The practical queetion ie, whether it ie cheaper to hring thie into our housee from under our feet, or ohtain our eupply by dieinterring and liherating the fossil eunbeame entombed in depoeits of coal. What I have read, remarke a writer in the *Gentleman's Magazine*, concerning these projecte, leade me to the conclusion that the coet of einking deep enough to hoil water, and then to convey the eteam, or otherwise the directly heated air, to our houees, will coet far more than the eams amonnt of heat from coal; but ae our thickeet, best and most acceeeihle coal seame proceed further towarde exhaustion, and coal hecomes conetantly much dearer, the caee may be different. The Americans generally take the lead in these very tall and extremely novel echemes, hut in this particular effort they are likely to be foreetalled hy the Japanese, who are eeriously contemplating the availability of the hot springs around Tokio as a eource of heat and power, and also of ueing the heat obtainahle hy sinking. The eubject wae introdued at a meeting of the Seiemological Society of Japan—a society which in ite own department (enrthquake study) ie doing good ecieutific eervice. Mr. Milne, who read the paper, proposee to convert eome of the heat into an electric current, and transmit the energy to the town. Thie, in a region where the hot eprings and earthquake disturbancee indicate a much more rapid increaee of heat than that ahove named, ie of course more likely to be within practical reach. Besidee this, the tapping of eubterranean heat in dietricts liable to earthquakee will probahly have eome elight effect in moderating those convnlsions.

The Porosity of Rocks.

Persons visiting the Comstock have often expressed surprise that no great cavities or caves were to ha seen at points where they were told great rnshes of water had occurred, which had flooded several levels and filled up shafts to a great hight. Our mining superintendents and mining men generally know that certain kinds of rock hold vast quantitiee of watar, but experiments have never been mads on the Comstock for the purposs of ascerteining the exact or even the approximate qnantity.

In England the matter is being pretty thoroughly investigated. At ths recent meeting of the British Association, C. E. De Rance read the report of a committee appointed for the purpose of investigating the circulation of underground wsters in the permeable formations of England, and the quality and qnantity of water supplied to various towns and districts from those formations, to which was added an appendix on the density and porosity of rock, in relation to the water supply. A knowledge of the porosity of rocks was etated to be important as regards the water snpply, the suitability of stone for huilding purposs, and in accounting for some of the lithological changes often observed in the strata of the earth. Though the metter had not escaped investigation, the vast volume of water stored in rocke had not heen fully realized.

The density of ths old red sandstone was 2.61, the volums of water abeorbed by a cubic foot heing over .707 gallons, and by a square mile threa feet thick 59,000,000 gallons. Conglomerated beds of the same formation ars still more absorbent, heing capable of taking .85 gallons per cnhic foot, or 67,000,000 gallons per eqnars mile, three feet thick. Ths millstone grits which lay at the base of the coal measures vary much in different localities, that found in the forest of Dean heing most porous and absorhing 66,000,000 to ths square mile, three feet thick. Some of the coal measure grits also stored large volumes of water. The Pennant rock, 900 feet thick, in the Bristol coal field, was capahle of absorbing 12,000 in a square mile, three feet thick, and epecimens of megnesian limestone taken from the neighborhood of Bristol gave 86,000,000 gallons, but the carboniferous limestone was quite the reverse, absorhing only 3,500,000 gallons.

Oblites were stated to hold vast stores of water, and the rock was used extensively for huilding purposes. From an analysis of rocks it is clear that nothing in their chemical composition could purify the water, and in ordor to get rid of organic contamination, there mnst he oxidation, and ths oxidizing agent wes considered to exist in the air, absorbed hy the water and air contained in ths interstices of the rock.

A REGION OF RICH MINES.—Speaking of Deep Spring valley, a correspondent of the Inyo (Cal.) *Independent* saye: Ths silver mines or ledges in this section, from which orse of marvellous richness have in places been extracted, ere not confined to nny especial point, hut are found here and there in the different formations, and carry ores as dissimilar as the formations in which they are found—chlorides, sulphides, brittle silver and other rich natural silver ores ars readily fonnd. Quality is not here the queetion, but one of quantity, which may be, and very possibly will he, answered on the right side in time. Some of the richest and most beautiful ores we have seen in the county we saw here. The purely eilver compoeitione here are prohleme to be worked ont with courage and care. Nothing can be eaid againet them from the surface standpoint, hut the pick, hammer and drill alone can determine their value in the hidden receesee nf lower levels. Ths argentiferoue galena veins are found in a vast dyke of dolomite extending along the eastern slope nf the White mountains, itself flanked on the east by a remarkably beautiful formation of argentine and trachite. This lead dietrict is a large and moet interesting one, presenting many propoeitione of great merit, which, despite past failuree in the reduction of oree, mnst have further attention paid to it. I am not at liberty to further diecuss its merits.

NOVEL BLASTING MATERIAL.—The following ie from the Virginia (Nev.) *Enterprise*, and no doubt Dan, of that papar, has a patent on it: It ie well known that in many of the coal minee coal is now being hroken down by means of the expaneive force exerted when quicklime ie firmly tamped into the drill holee. Having heard of the suocese of thie experiment, a German brewer of thie city is anxious to make an experiment in eome one of the Comstock minee. He says he will prepare a yeast which, being eecurely confined in a drill hole, will rend apart the hardeet rock. He eaye the minee of the Cometock afford peculiar advantages for the use of his explosive. Owing to the heat of the rock, fermentation will begin the moment the charge ie tamped, and will soon become eo active and fierce that nothing can resist it. He has already hlown up a dozen or more etrongly-hooped heer kegs, hae hlown one end out of his hrewery, hae heen severely wounded in the leg by a flying eplinter, and has not yet need hie explosive in half as strong a form ae he can make it by putting in a few more hops.

A GOOD IDEA.—Experimental farms will be eetahlished hy the Texas and Pacific Railroad along its line next season. The purpoee of theee farme will be to teet the availablity of lande for different farming purpoees.

MECHANICAL PROGRESS.

Wear and Tear of Belting.

Too little attention, as a general thing, is given to the study of the wear and tear and the general nss of belting. The *Wood Worker* furnishes the following good and practical suggestions nn this subject:

How long will a helt last? is almost synonymous in its indefiniteness with the qnery: How large is a piece of chalk? There are so mnny conditions entering into the solution of the question that a mere knowledge of nne or two will hardly prodnce a satisfactory resnlt. Among the valuable elements entering intn helt depreciation may he mentionod its length, width and thickness, strnin, friction or power to transmit tension, propor adjustment and temporntnre. If the helt is of leather and oak-tanned it will last one-third longer than if chemical-tnnned. The manner in which helting is laced or joined together makes a great difference in the wenr. Having each end of the piecee to he joined cut off true and sqnare, and not laced too tightly, and the wear ot the helt may be decreased two per cent. per year. Some of the methode used to prevent a helt slipping on the pul'ey are detrimental to its wear, among which may he mentioned powdered resin or pitch, which soon penetrates the leather and rots the belt. Roughing the snrface hy filing is another eonrce of wear. Running the helt on too tight a pulley will generate heat, decompose the nil end organic matter in the helt, and hasten its decny. A helt of unequal thickness will not only run badly, but wear much faster than one of equal thickness throughont. Rnbber helts depreciate fastor than leather. Frequently a few minntes of quick motion will roll the gum off in such quentitiee as to entirely destroy the helt.

During freezing wosther, if moisture finds its way into the seams or hstween the different layers of canvae in rubber helts, and becomes frozen, the layers soon tear apart and the hslt is ruined. Again, if they are used for cross belts, shifting helts on cone pulleys, or any place where they are liable to slip, frictiou soon destroys them. Using leather helts in damp places, or where steam comes in contact with them, matorially hastens depreciation. Short driving belts depreciate more rapidly than any other, nnd need to he replaced every 10 or 12 months. Generally an 8 to 16-inch helt will wear from 6 to 8 years. Taking all the fects into consideration, and the entire amount of helting used, a fair deprecietion wonld he: Flouring mills 10%, irnn workers 12½%, and wood workers 20%. Belts in contact with steam or moisture will depreciate 10 % faster than when run in a dry place.

The helting of a shop is a good criterion hy which to judge of the value of the mschinery of a shop. A person not a machinist might he hothered to tell whether the machinery of a shop was in good condition or whether the hsiness was profitahle. Theee doubts can he materially lessened hy a glance at the helting. If the general make-up is had, if the hslte are all patched, frayed out or hedly douhled at the edges, and have a sort of thrown together look, or if there is a deal of wohhling on the pulleys, and a sort of general shahhiness throughout, it can he safely set down that the concern is hard up, or the machinery is hadly worn, or that there is a scarcity of work.

A Novel Iron House.

George L. Huston, of Parkershurg, Chestor county, Pa., will huild a palatial private maneion for himself entirely of iron, the foundations heing of solid rock. The architect is an Englishman whom Mr. Hueton recently met while abroad. The floor of the hall, vestihule and library will hs laid with polished cast iron tiles, in which different qualitise of iron will he used to produce the same variety of color as in ordinary tile flooring. All the other floors of the house will he of stout iron platee firmly holted to the iron joiete. The outeide walle and ineide partitione all through the structure will he compoeed of two coureee of iron platee firmly holted together eo ae to be air-tight. These hollow iron walls and partitione will he ueed instead of chimneye for conveying heat to different perts of the house and for ventillation. The hot emoke and gaees from the furnacee passing through the sidee of the rooms in thie way will, it is claimed, he almost sufficient to keep the house comfortahle in the coldeet weather, so that the heating can he done with about one-half the fuel required in ordinary housee. All the doore and window eashes wil also he iron, hut will hs constructed in such a light way and so nicely halanced upon hingee and weighte as to open and shut as easily as those made of wood. All the ineide walle and partitions will he handeomely painted and frescoed so as to present the appearance of an ordinary house finished in plaster. Outeide the etyle of architecture will he light and graceful, and it will he pninted and ornamented so as to look ae if it wae huilt of wood. The roof will he of strong hoiler plate, and on the top at the convergence of the four gables will he a handsome obsservatory, supported at the cornere hy four Ionic pillars of iron. Inside the ornamenta will he of the same material. In the parlor will he a mantel of polished eteel, handsomely ornamented. There will he a eimilar one in the dining room, upon which will he engraved hunting ecenes. In the library will he a maesive mantel; sn construoted that it will lnok as if it wers made of pig iron fused together. Quite a curiosity in thia room will he a cahinet for the exhihition of specimens of iron. This will be constructed entirely of strongly magnetized iron, so that all the specimens will adhere to the hack nf it, held in place solely hy magnetio nttraction. In order to gnard against the hulging which would take place in snch a solid iron structure on account of the contraction nnd expansion canssd hy the heat and cold, there will he hrenks in the iron at intervals, whioh will he filled with rubher, so that when expansion takes place thore will he room for it without producing any ohange in the contour of the frnmewnrk. As muoh as possihle of the furniture will nlso he nf iron, so thnt if it takes fire in any part nothing can hurn hnt the carpets and the few articles of wood that mny he within reach of the flames. The house will he an architectural and scientific curiosity. Mr. Hnston admits thnt it mey cost twice or three timee as much as an ordinary house, hut olaims that with a little attention it will lest for centuriee without repairs, nnd will never cost a cent for insurance.—*Reading Eagle.*

How to Melt Babbitt Metal.

L. Y. Lyne, in *American Machinist*, snys: "I wish tn sny a few words in reference to the treatment of Bahhitt and other similar antifriction metals. Workmen who are accustomed to mixing or treating metele while in liquid etate will generally melt such metal upon a hlncksmith's forge hy applying heat so rapidly that the ladle will hecome red hot hefore the metal within hegins tn melt. When it has molted a dross rises to the surface and is skimmed off hy the workmen and thrown away. The skimming process is kept up as long as the ladle is kept nn the fire. Now snch a course is all wrong, hecense, hy applying heat too suddenly, the metals which fuse at lower degreee of heat, sweat out, and are hurned hefore those which melt at higher temperatures become fluid. The dross, as it is commonly called, which rises to the surface, is in many cases the antimony or hardening property of the alloy, and should not he thrown away. The surface of the metal should he kept covered with fine charcoal, which will prevent oxidation. A small lump of sal-ammoniac should also he kept on the surface nf the metal. The metal ehonld elways he stirred hefore ponring, otherwise the heaviest metals will separate and sink to the hottom of the ladle, and a constant varying quality of the metal will he the resnlt. Hy melting the metal slowly and keeping it properly fluxed as described, it will runsharp, each casting will he uniform throughout, and the metal he of equel hardness. In observing these simple precautions, much of the dissatisfaction now experienced in using Bahhitt and other antifriction metals will disappear, and the metal not he condemned hecause it simply obeys the lawe nf nature and separates when improperly treated."

STEAM PRESS FOR TOOL-MAKING.—A steam hammer or press has lately hsen invented, the rapid operation of which enables certain descriptions of tools or implements to he produced at a much less cost than heretofore. The weight of the machine is some 13 tons, and in ite operation diee are used according to the shape of the tool desired. In these dies a piece of iron of the proper weight is put, and hy intense pressure the metal is fashioned to the desired shape. By an ingenious arrangement the iron is "steeled"—that is, the required portion of steel ie welded to it hy pressure from four directions, when it is again placed in the die, repressed, and the "eye" punched; it is then taken to he pointed and dressed ready for the market. The capacity of the machine is rated at 24 dozen hatchets per week. A workman, hy the ordinary method, could not turn out more than 10 dozen in the same length of time. It is also applied to the cutting of iron, ite rapid and effective action insuring a considerahle saving of time and lahor. In this latter operation a heevy knife is pnt npon the machine, and it will make a clean cnt of two and a quarter by one and a half inchee through cold iron.

A CHEMICAL TREATMENT FOR VENEERS.—A recent chemical treatmont of veneere hee heen succeesful in London, it ie eaid, whereby the veneer can he made enple ae leather and of lese than the uenal thicknees, while the etrength and heauty of the wood arennaffected. The veneer thne prepared can he ueed with the utmoet ease and safety on the moet elahorate workmanship, banding around the most acute anglee and most intricate curvee. They do not need any preseing hy mechanical methods or conforming with hot irone, a eimple laying on with glue and hand preseure heing all that is required.

STRAW LUMBER.—The California *Architect* euggeste that some of our California inventore ehould grapple with the problem of straw lumher. There is no State in the Union that preeents so many advantages ae California in regard to obtaining large quantitiee of the raw materiale. If a ton of straw will make 1,000 ft. of lumher, eurely the plaine of Coluea and Stanielaus can he relied upon to produce thoueands of tone of straw, and therefore thousands of thousande feet of lumher. Who will he the first to move in the matter? Such lumher is ueed principally for store finish and wainecoting, where it ie desiraole to have a contrast of light and dark woods.

SCIENTIFIC PROGRESS.

A New Telephone—Possibly.

Mr. J. W. Heiss, qnite a yonthful telegraphio operator at Matrous Station, some 20 milee north of Los Vegas, in New Mexico, has invented a new talking mechine, whioh, he claims, will he muoh superior to the Bell or any other telephone now employed. He calls his deviee a vihraphone. He wns recently interviewed hy a newspaper reporter, to whon he talked in snhstance as follows:

I will try to explain my invention to you as hest I can; hnt it is almost impossible to show it to you in all its minute particulars. Here I have a small piece of walnut, one and three-fourths inches thick and three inches wide. In the one side you see a concaved hole, one and a half inches deep, shaped like the hottom of a tee onp, and ahout two inches wide at the top. In the hottom of this hole is anothor hole three-fourths of an inch deep, which opens through to the vihrator fastened to the other side of the hlock, and of the seme size as the hlock. The vihrator is made of tin, such as is used hy photographere in taking tin-type pictures. On the outer center of this tin plate is fastened a smell carhon point ahout as thick as a slate pencil and one-fourth of an inch long. Another piece of carhon ahout one-fourth of an inch square and one-eighth of an inch thick is securely fastened to a small strip of thin hrass the same width as the carhon, which comes directly over the carhon point fastened to the vihrator. Above the square carhon point is a screw whioh, when turned, presses the square carhon down until it comes in contect with the small carhon point. From each of these carhons is connected a small hair wire which connects on eech side of the hlock with larger copper wires, which connect to the main telegraph line. This is ahont all there ie of it, and in singing into the concaved hole the vihration is formed on the tin plate, and the carhon conveye the sound to the line. The delivery is made at relays in the office along the line. It is nothing like a telephone, es it has no coils or magnet complications to interfere, making it much smaller and more simple in its working than Bell's patent or the Blake transmitter. A common cigar hox will enclose the whole thing.

I can make any sound that ie audihle here in the room he heard all along the telegraphic circuit of New Mexico, much further than a telephone can carry the eeme noise. Of course you must nnderstand that my machine has not been completly perfected as yet, hut thus far I heve heen ahle to he heard plainly. Singing songs and giving hugle notes and the different tunes can he easily distinguished, no matter how far off the listener may he.

What I am now working at is to get the contrivance so I can talk in it and he heard distinctly along the line without the use of an audiphone, snch as is used with the telephones. If I can do thie it will he a great scientifio curiosity. I can talk some with it now so as to he nnderetood, hut it is not the complete success I wish to make it. I have a caveat filed, so no one can get a patent on anything like it hefore I get ready to patent it myself. Of course I feel highly elated over the outlook, for the success thns far gained is more than I had anticipated. Mr. Heiss, adds the reporter, hae certainly stumhled upon amost wonderful discovery, and fame will come to him as it has to Morse, Edison and Brush, the fathers of the different developments of electricity.

A PLAGIOSCOPE.—A curious project in the way of scientific recreation, hy M. Joyeux, is published in *La Nature*. Suppose a large circular wooden chamher, lit from ahove, hut giving no view of the outer objects from within, and rotated smoothly end rapidly on a vertical exis. A person standing in it would have to hend his hody toward the center, hy reason of centrifngal force, and the more eo the further he might he from the center and the higher the epeed. M. Joyeux eupposes he would he euhject to the illusion that the floor wae inclined upward from his position to the oentsr; if he had to place himeelf at an angle of 45° the floor would eeem inclined at thie angle, and a pereon standing in the corresponding place on the opposite side would eeem horizontal, for he, too, would have to make an angle of 45°. Only at the center would the floor eeem horizontal; and if a number of pereone were in the chamher, it ie only there one would see them in their real positione. A pereon walking round the circumference would eeem to he at the ontside of the base of a code which turned under him. To facilitate the peeition of persone, M. Joyeux would make the floor not horizontal, hut inclining upward, at a certain distance from the center. M. Tiesondier doee not feel certain that the illusions described would actually occur, hut regarde the echeme as an attractive curioeity. The apparatus ie named a *plagioscope.*

A NEW ELECTRIC REGULATOR.—Heated air warms the halle of the five lahoratoriee of the Scientific echool in Aix-la-Chapelle. The temperature ie regulated hy electric thermometere, which transmit to the heater the eignals "too cold" when the temperature ie helow 62.6° Fahrenheit and "too warm" when it risee ahove 66.2° Fahrenheit. Either gae or electricity may be ueed to light the great amphitheater,

The Disruption of the Comet.

It will he recollected that we puhlished a paper some time since from Prof. Davidson, in which that gentleman held, after careful observation, that the disruption of the oomet, as reported hy some of the Eastern and European observers, wns merely an optical illusion. We notice, however, thnt Eastern observers still adhere to their expressed opinion that there has heen sn actnal disruption. Mr. R. Brooks, of the observatory at Phelps, N. Y., writes to the *Scientific American*, under date of Nov. 4th, as follows:

I beg leave to say thet the reason why the search for my new fragmentary comet, made at Washington four or five dnys after discovery, was nnsuccessful, is that it wns made during the period of a full moon, which would have rendered so delicate an object invisihle even if it had maintained the same hrilliancy it had at discovery. It did not, however, hut grew rapidly fainter, for in 24 hours—at my second ohservation—it had become, as announced at the time, hoth fainter and smeller.

The small comet discovered hy Prof. Schmidt, at Athens, four degrees southwest of the great oomet, for which careful esarches had heen made, uotahly the one at Princeton, had as quickly disappeared, and likewise the cometa y masses seen hy Barnard, at Nashville.

The prohahility is that all these messes, thrown off from the great oomet, were rapidly dissipated or diffused. Although of such short time visihility, the independent discovery hy Schmidt, Barnard and myself of these different oometary massee substantiates and confirms their reality.

THE COMET.—An observation, unprecedented in the hietory of oomets, wes made, saye *Knowledge*, at the Cape Town observatory, on Sept. 17, at 4 h. 50 m. 58 sec. Cape mean time, corresponding to 3 h. 37 m. 3 sec. Greenwich time. "The comet was followed," writes Mr. Gill, "hy two observere with seperate instruments, right up to the sun's limh, where it suddenly disappeared," at the hour named. To he seen under these conditions the comet must at the time have heen intensely hrilliant—partly, no donht, the effect of solar heat and light, hut partly also, we conceive, on account of the resistance it experienced in its onward rush at the rate of certainly not less than 340 miles per *second*. The time when Mr. Gill's assistants saw the comet reach the sun's limh, preceeded hy 1 h. 35 min. the time of perhelion passage as given helow. The Emperor of Brazil telegraphs to the Academy of Sciences that the comet was visihle in full daylight on the 18th, 19th and 20th of Septemher. The spectroscope showed the presence of sodium and carhon. On the 26th, from 4 h. 10 min. to 5 h. 40 min. it wes a splendid object.

DARK BODIES IN THE SOLAR SYSTEM.—Sir John Lnhhock's opinion endorses the conclusion long since put forth hy some of the most eminent astronomers—namely, that there are now in the eolar system, or firmament, many dark hodies—that is, hodies which emit no light, or comparatively little. He points out for example, that in the case of Procyon, the existence of an invisihle hody is demonstrated hy the movement of the visihle star. Another illustration whioh he cites relates to the notahle phenomena presented hy Algow, the hright etar in the Head of Medusa. This star ehines without change for two days and 13 hours; then, in three hours and a half, dwindles from a star of the second to one of the fourth megnitude, and then, in another three and a half hours, reessumes its original hrilliancy. According to the view entertained hy Prof. Lnhhock, these changes must he regarded as indicating the presence of an opaque hody, which intercepts at regular intervals a part of the light emitted hy Algow.

INSULATING MATERIALS.—The immense strides which have heen made in electrical discovery, particularly in practical applicetious, have compelled electricians to seek for new and cheaper inculating materiale than thoee already in use. Hitherto they have heen limited to glase, porcelain, etoneware, gutta percha, India rubher and ehonite. Owing to the greatly inoreaeed demand, the price of the last three named has risen very muoh, and is likely to rise still more, and, while the quality has deteriorated, it is impoesihle for the exieting eources to eupply what is needed, not only for telegreph and telephone work, hut for the immense field opening in eléotric light work. The public require, hefore everything, eafety in the nee of electricity, and there is a correeponding demand for a oheap inculating material, the supply of which ehall he equal to the demand likely to ariee.

THE hlood of crahs and other crustaceane hae hesn proved hy M. Fredericq to have the same ealine conetitution, and the eame strong and hitter taste as the watere they inhahit. But the hlood of eca liehee ie very different. It hae not the eame constitution as the water, and thue ehowa a marked euperiority over that of crahe.

LONG DISTANOE TELEPHONING.—An experiment hae heen made hetween Melhourne and Alhury which ehowe that ordinary telegraph wires will, for a distance of 200 milee, serve to convey telephonic meseages.

Oxalic acid is found in the common sorrel and rhubarb plante.

Mining Share Market.

Mining stocks have been very dull for a week past. The east and west crosscuts on the 2700 level of the Sierra Nevada are still in a mixture of quartz, clay and porphyry, differing very little from the vein material of the main north and south drift whence the crosscut started. The joint winze of the Ophir and Mexican below the 2900 level is in a formation consisting so largely of quartz that it does not blast as well as heretofore. The large admixture of quartz renders the ground "short," which means that it does not break out well. This would seem to promise interesting ground in which to begin explorations when the 31000 level is reached.

A suit for injunction has been commenced against the Bullion M. Co. by Henning Thode. The complaint alleges mismanagement and frauds by the directors of the mine. Thode charges that $800,000 has been collected in assessments by the directors since 1880; that by fraudulent pay-rolls and by extravagant salaries to the superintendent, secretary and other officers, the stockholders were cheated; that the only labor performed since February last is the levying of assessments. It is also charged that the directors have been in the habit of selling out their own stock and levying heavy assessments just prior to an election for direotors, the object of which scheming was to perpetnate themselves in control of the mine, The debts of the company are about $30,000, and there is $20,000 on hand, besides a collection of assessments for nearly as much more. The injunction is asked to prevent the directors from selling 30,353 shares of Bullion delinquent stock, which the plaintiff claims is about to be fraudulently disposed of, so that the directors may become the purchasers of it indirectly. The Bullion is a Comstock mine.

PERSONAL.—Mr. Fraser, of the firm of Fraser & Chalmers, manufacturers of mining machinery in Chicago, is at present in this city. He has just made a business trip through various mining camps in New Mexico and Arizona, and his stay in the mining regions was so short as to prevent his giving any details of the work going on. He has been favorably impressed with the general prospects of most places. He thinks both these Territories will fill up more rapidly as their mining resources become better known. Mr. Fraser will return to Chicago in a day or two.

THE OUTLOOK.—A gentleman well posted in the mines of southern Nevada informs a Carson *Tribune* reporter that near Lnning, Esmeralda county, and, in fact, wherever the road extends, the indications are favorable for the discovery of mineral-hearing ledges that are likely to eclipse the Comstock. This seems the general opinion of those who are competent to judge ooncerning the locality.

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superior Court, Department No. 10, San Francisco:

North Pacific Railroad Extension Co., Dec. 6th. Object, to construct, equip and maintain a railroad from a point on the line of the North Pacific Coast railroad known as Corte Madera Station, in Marin county, to Saucelito, and such other railroads in connection with any point or station on the line of the North Pacific Coast railroad to any place in the State desirable to be connected with said Nortb Pacific Coast railroad. Capital stock, $1,000,000, in 10,000 shares Directors: James D. Walker, Thomas Menzies, Daniel Nye, F. R. Calton and Donald F. Tillinghast.

Etna Iron Works Co., Dec. 6th. Object, to manufacture iron tools, implements and machines. Capital stock, $500,000, in 5,000 shares of $100 each. Directors: G. H. Malter, Thomas Pendergast, George Johnson, Thomas Price and A. M. Starr.

United Investing and Manufacturing Co., Dec. 6th. Object, to buy and develop patent rights and inventions. Capital stock, $300,000, in 30,000 shares of $10 each. Directors: L. D. Craig, S. D Valentine, John H. McNee, W. E. Stevens and D. B. Francis.

News in Brief.

THE Czar of Russia has assumed the title of Lord of Turkestan.

REAR ADMIRAL WYMAN, U. S. N., has been stricken with paralysis.

THE reduction of the public debt for November was $5,534,142.

AN asbestos factory and other buildings were destroyed hy fire Thursday at Quebec.

THE South Ynha canal company is building a ditch 12 miles long, to cost $20,000.

THE Alhany iron works, employing several thonsand men, have reduced wages from 10% to 25%.

THE Saltan of Turkey is in great terror of assassination, and hardly dares show himself ontside his harem.

A REPORT is current that Potter has sold all his holdings in Omaha, and that Vanderhilt has bought them.

THE year's embezzlements and robberies in Russia, private and official, will amonnt to 26,000,000 roubles.

THE North Side Rolling Mills at Chicago have shut down, throwing 1,800 to 2,000 men out of employment.

THE corn crop of the United States is estimated this year at 1,680,000,000 hushels, and the wheat crop 500,000,000.

AN actress was killed on the stage at Cincinnati Thursday hy Frank Frayne, who endeavored to shoot an apple off her head.

THE issue of standard silver dollars from the Mint for the week ending Dec. 2d was 802,000. against 536,500 for the corresponding period last year.

TO THE reckless cnstom of climbing on and off cars while in motion, so common in Chicago, is due most of the accidents which have occurred on the cable roads.

THE internal revenne collections in California district during the fiscal year ending June 30, 1882, were: First district, Chancellor Harrison, colleotor, $3,814,692; second district, Amos L. Frost, collector, $3,122,840.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

ALPINE.

ORION.—*Monitor-Argus*, Dec. 1: Work is progressing rapidly on the Orion, and within the past few days a ledge has been struck in running the crosscut, which is said to be a well-defined ledge, 6 ft in widtb, and assaying $100 per ton in gold and silver. This is a very promising mine of immense riches, and that in the near future it will yield a large amount of the precious metals is almost beyond a doubt.

BADGER HOLE CLAIM.—David Clark, who has been employed at the Mineral Oreen mine, while passing to and fro over the trail leading from Markleeville to the mine, discovered from the boriogs of a badger hole what he considered favorable prospects of a gold-bearing quartz. After pondering over what possibly might be discovered, he set to work with his pick and shovel, and after digging a depth of about 2 ft, succeeded in uncovering a blind ledge, well defined, and widening out from where he first struck it from 14 inches to 3 ft, and the ledge was only followed to a depth of about 8 or 9 ft. On taking some of the rock to an assayer, and having it tested, it shows an assay of $60.29 in gold and $1.89 in silver; total $62 18.

ISABELLE G. & S. M Co.—The company closed temporarily over three months ago, in order to make some necessary improvements in the Exchequer mill for increasing the facilities for working the Stella ores, by enlarging the furnace for roasting, and putting in two large new agitators, which will give the company facilities for working at least 10 tons of ore a day, instead of 3½ tons a day, as heretofore. With the increased facilities for working the Stella mine and the ore, we hespeak a brilliant future for the company.

EXPERTEN.—The Colorado G. & S. M. Co.'s mine at Montior, and the Altures mine in Hope Valley, have been visited by a mining exoert recently, and we learn that after visiting our mining regions he expressed himself very favorably of them. But how favorably he may report on the two mines he experted on depends largely on the sample ores taken away with him for assaying. We hope outside capitalists may receive such encouragement from our mine owners that something may he done towards the development of some of the best mines in California.

AMADOR.

WORK SUSPENDAD.—Plymouth Cor. Amador *Ledger*, Dec. 2: The Pioneer and Green Aden mines have come to a standstill, and all the tools have been removed. The Pioneer is owned by John Evans. McNeven & Co. bonded it for one year, on condition that if it turned out favorably they would purchase it for $10 000, and if not all the improvements were to revert to Evans. The Green Aden claim was sold to the same parties. They were to pay the owner, Oreen Aden, $2 500 before striking a lick, and eight months thereafter $27,500, making $30,000 in all. The agreement was oral. The first installment was to have been paid last Monday. McNeven sent word to other members of his company to be in Plymouth by that time with the coin. They arrived Sunday evening. Failing to see Aden business called them away, and they let it, saying that the owner could keep his mine and they would keep their money. Aden came to town two hours after the men had left, and of course expressed his regret at the turn things had taken. McNeven & Co. had arranged to spend $100,000 in prospecting the two mines. Evans has a new blacksmith shop and about $300 of work left on his hands.

MISCELLANEOUS.—A crushing of ore from a new location in Pioneer district was lately made at Mace's mill. It was the expected that it would yield over $5 or $6 to the ton, but the owners were agreeably surprised to clean up nearly $10 per ton. F. Mace is half owner in the claim. They are now running a tunnel to tap the ledge at a considerable depth This tunnel is in 80 ft, with 20 ft more to reach the desired point. The ledge is 2 ft wide, with a tendency to widen as it goes down..... We are informed that James Morgan is well satisfied with the result of the crushing of rock from bis claim in Murphy's Gulch at the Moore mill. He is now below, but is expected up this week to enter upon the work of opening up the mine on a larger scale.

BUTTE.

GOLD DOST.—Butte *Record*, Dec. 2: A Butte Creek miner arrived in town this morning, and deposited $1,500 worth of dust in the Bank of Butte County to be shipped to San Francisco to-morrow. The miner said that work in the different claims was quiet at present, but little gold being taken out. Besides being engaged in taking out the precious metal himself, he buys considerable of the dust from other miners.

MAGALIA RUDGE.—Oroville *Mercury*, Dec. 1: Increased attention has been given to the mines about Magalia lately by contests for the ownership of certain lands in that vicinity. It seems, from what we can learn in conversation with those familiar with the region, that there are several rich gravel channels running from northeast to southwest through the country there, one of which is that upon which the Pershbaker claim is on; another, known as the channel, coming down from Plumas county, where the Little Chief M. Co. is operating; and still another lying on the south parallel. Wherever bed-rock has been reached in these ancient streams they have been found very rich, and many hundreds of thousands of dollars have been taken from the mines that are worked. For some time Samuel McClellan, Sheriff elect of this county, has been the owner of a large tract of mining land covering these channels, which is as yet undeveloped. Last summer John Onidery, who also had locations adjoining McClellan's ground, conceived the idea of consolidating his and McClellan's interests, together with other claims contiguous, and forming an association with capitalists for the purpose of developing the ground. This consolidation embraces nearly 700 acres, and lies principally between Middle and Little Butte creeks, and preparations are being made to sink the first shaft upon the northern most channel (supposed to be on the Pershbaker lead) in the canyon of Little Butte creek, where that stream cuts across it. The bottom of this channel, judging from the physical surroundings, is about 75 ft below the surface at this point; the next channel south—the larger one, which comes in from Plumas county—is estimated to be deeper—from 150 to 200 ft to bed-rock from the surface of the bed of Little Butte; and the southernmost and smaller one, about 50 ft deep. Still further south upon these ancient streams other companies are working—Hill & Co, on the larger middle channel, who have quite lately struck into gravel by tunnel which pays $4 to $5 a day to the man. The McClellan and Guidery ground lies in Sec. 23 and 26, Tp. 22 N., R. 3 E., in a direct line about a mile and three-quarters southerly from the Pershbaker claim. Mr. Ouidery was here last week, arranging for the commencement of work, and no doubt we shall in a few months be enabled to chronicle important mineral developments as the result of his energy and faith.

CALAVERAS.

MURPUY'S.—Cor. Nevada *Echo*: That we have no mines here is verified by the selling of $124 of gold yesterday, pounded out in a hand mortar in one day from ore taken from tbo O K mine. This mine is now looking finely. The vein is in its greatest width (2 ft), all of it good. There will be more of such mines in the railroad times. Recent assays from pound assorted samples, below the average, from the Eddie Dewalt mine, per Hallock process, worked $17 per ton. There are 20 tons of ore on the dump of tbis mine that will work $60 per ton. Whitney's Bon Ton mine, on San Antone creek, has started up again. This is a large mine.

ANOTHER HYDRAULIC CLAIM.—*Chronicle*, Nov. 2: We are informed that a hydraulic claim is being opened in Old

Woman's gulch on the east side near where the San Andreas road crosses the gulch. A flume has been laid and other work done, indicating a purpose to commence hydraulic operations soon

EL DORADO.

GRAVEL.—Georgetown *Gazette*, Dec. 2: There is an immense extent of auriferous gravel, capped with cement, lying in El Dorado county, in the vicinity of Volcanoville, which has yet been only partially prospected, and which is believed to contain untold millions of wealth. A better opportunity for the safe investment of capital is not offered anywhere in the State than in opening up the ancient gravel beds of El Dorado county.

BUCKEYE.—Mr. T. C. Nattrass is preparing to start up the Buckeye gravel mine near Volcanoville. Mr. Parkhurst went up with a load of pipe for this mine on Tuesday. Mr. Nattrass starts in with very flattering prospects, the gravel bed being very extensive and prospecting splendid pay—all the way from a few cents to $4 to the pan. The Buckeye adjoins the Flora claim, and is evidently a continuation of the rich gravel beds of Placer county near by, on the other side of the river.

OAK.—Superintendent Hart, of the Josephine mine at Volcanoville, departed for San Francisco Monday morning on a flying trip. They have encountered a large body of rich ore on the third level, 300 ft below the surface, the lode being 10 ft in width, and now they are about to move their mill down the hill at a point below the outlet of the lower tunnel, and use water power instead of steam. It is thought by parties in this place who have lately examined this mine that it is the best quartz mine in the county. Mr. Hart is deserving of much credit for his untiring enterprise in opening up this property.

INYO.

A RICH STRIKE.—*Independent*, Dec. 2: Through letters from W. A. Greenly, of Deep Spring Valley, we learn that as work goes on their mine there is constantly improving. Mr. Greenly, who is as reliable a man as this country can boast of, reports a new gold discovery in the White mountains, about three miles north of his place, and between there and Fish Lake Valley, to the west of Cottonwood creek. It was made by Piper & Co. last week. The ledge is said to be immensely rich, showing nuggets of gold and the richest description of quartz.

MARIPOSA.

MERCED RIVER MINES.—Con. Mariposa *Herald*, Dec. 2: The Breen claim, owned by Dan Breen & Co., is on what is known as Cope's Flat, above the mouth of Hall's gulch. This is a good, paying claim, but the great trouble is that the main channel is below the present bed of the river, which cannot be worked without the aid of machinery. They have made several attempts to get the bottom, but have always failed on account of the water, which came in volumes out of the river. Dan says he will find the bottom another year if all is well. They have worked out most of the high ground, which has paid first-rate so far .....Bowlder Bar, owned by Schanz & Hunsaker, is situated about a half-mile above the Breen claim. This claim was discovered by them last spring, and promises to become one of the best on the river. They have lately purchased a lot of hydraulic pipe and a "giant" with which to work it on a larger scale. They have also cut a large ditch in Wood's gulch, with which to convey the water to the claim. In all they have expended several hundred dollars in improvement and labor. All that is lacking now is water.....McCabe's Flat, owned by Murray & Jacony, is also a good paying claim. They drift out the gravel, and pile it up till water comes. They "clean up" the bedrock as they go along, carry it to the river and "wash" it with a rocker. This alone pays them good wages. The gravel that is piled up waiting for water prospects from a cent to a dollar to the pan. They will undoubtedly make a good "clean-up" when water comes.....One great trouble down here is the lack of water. Though a river is running at our feet, yet it does us no good. It cannot be brought into these bars without a great expense. It would cost several thousand dollars to get it high enough to do any good whatever..... This part of the country is not half prospected yet. I believe that there are plenty of good quartz veins on these hills around here, as most of the gold that is got here has more or less quartz in it. There has never been a great deal of work done here by white men. It has been done mostly by the cursed Chinese, who have worked out most of the shallow bars, and would have worked out the others but they are afraid of high banks. If a man has a mind to work, this is about as good a place to find a placer or quartz claim as there is in the county, but it takes plenty of muscle and perseverance, as the gold does not lie about loose.

NEVADA.

CLOSED DOWN.—North San Juan *Times*, Dec. 2: Geo. E. Yates, of Sweetland, who has been superintending the China mine, at Moore's Flat, for many months past, made us a very pleasant call on Tuesday last. He informed us that the mine made its last clean-up for the season on the 21st inst.; that the company is now engaged in cutting down bedrock and putting in new sluices, preparatory for the commencement of work as soon as water is more abundant. The China mine is one of the best on the ridge.

JAMES O. SWEETLAND, ESQ., informs us that the Bedrock shaft at Birchville was completed on Tuesday last at 2 o'clock P. M. The boys had a jolly time over it all Tuesday afternoon. The shaft is about 250 ft in depth from top to tunnel. It is a grand work, and reflects much credit on its projectors. During the work on the shaft very rich gravel was found 40 ft above the tunnel. The company has commenced the manufacture of pipe on the ground. The tunnel is already prepared for the sluices, and as soon as the pipe is completed the company will be ready for washing.

PLUMAS.

CRESCENT MINES.—Greenville *Bulletin*, Nov. 29: At the Crescent mine the drain tunnel is not yet completed, though but little remains to be done. The mill is running steadily. Not more than 16 stamps will be used for some time, and all of these have not yet been started. The mine is looking well, and new ground is being rapidly opened up.....At the Taylor-Plumas the building for the new mill is going up very rapidly. The weather continues most favorable, and a few more days' work will put everything under cover. Most of the material is already on the ground, so that should bad weather set in but little, if any, delay would be caused in completing the mill. In the mine there is nothing new to report; work is going on as usual.

TUOLUMNE.

WATER.—Tuolumne *Independent*, Dec. 2: On the side of Table Mountain, at the Montezuma mine, there has been within the past year a deluge of water covering about an acre in extent. This water-spout, or whatever it might have been, has dug into the earth between 3 and 4 ft, washing out trees and brush, and rolling huge bowlders, weighing tons, from their natural beds. From the appearance of the land the water must have descended in a circle, and afterwards found its way down the mountain, washing out the road and everything that came in its way. It being in an isolated place, no one knows the precise time of the occurrence.

WORKMEN have been engaged for some time past, night and day, in washing down the Columbia Gulch flume. As it has not been cleaned up for several years, the job is more extensive than usual. It will be finished next week.

NATE ARNOLD is washing up the waste dump on his mine, and is making $100 per day, of about five hours' work.

J. G. DIVOLL, after a brief visit home, went below again on Wednesday evening. He is pushing his water scheme with his usual vigor, and is bound to make it a success.

NEVADA.

BRISTOL DISTRICT.

GOOD ORE.—Pioche *Record*, Nov. 25: On Wednesday Wm. Ross received a message from the Mayflower mine, informing him that there were encountered 4 ft of good ore in the mine. Manager Henry Goodhus and Mr. Crooker were in town at the time, and the good news made them smile from ear to ear. The Bristol Co.'s affairs are now being conducted in the proper way. The foolishness of running the mill on tailings and low-grade ore, at a great loss to the company, has been stopped, and the mine is being worked in a miner-like manner. Since Mr. Henry Goodhue came to this country and took charge of the Bristol Co. he has always lent a willing ear to practical and experienced mining men, and had former managers done likewise much trouble and expense would have been saved. May the new ors grow immense in dimensions and the stockholders become wealthy.

PREPARATIONS are being made to start sinking the new shaft at the Day mine. The interior of the mine is looking good, and the work of sinking and running drifts is being pushed ahead with a full force of men.

YIELD OF BULLION.—The yield of bullion in this county for the quarter ending September 30, 1882, was as follows: Day mine, Jackrabbit district, $33,634: Bullionville Smelting Co., $41,303; Lazard Freres, 10 tons of ore from the Raymond & Ely black ledge, $339.74; Techaticup mine, El Dorado canyon, $26,753 90. This total yield of bullion for the quarter, $157,800.74. Owing to there being allowed $15 per ton on the Freiberg process, this bullion tax amounted to only $629.86.

CENTRAL DISTRICT.

STRIKE.—*Silver State*, Dec. 3: Alex. Wise, who has returned from Central district, reports that a vein of rich ore, over 20 inches wide, has been struck in the shaft which he is having sunk on the Keystone mine. The ore is argentiferous galena, worth about $300 per ton.

COLUMBUS DISTRICT.

NORTHERN BELLE.—*True Fissure*, Dec. 2: Eighteen ft have been added to the length of the main drift on the fifth shaft level during this week. This extreme heat has obliged a discontinuance of the work at this point until the air connections are made with the level above. The heat, however, does not interfere with operations in other parts of this level, as a winze has just been started on the streak of rich sulphurets found some time since, and from which favorable results are anticipated. The stopes on the second shaft level are looking well, and continue the usual yield. A very favorable development has been made above the first shaft level. In stoping to the west a body of fine ore has been opened, which is 3 ft in width, and seems to be entirely distinct from that now being taken out from the same vicinity. The other shafts levels present no change of note. The drift to the north from winze No. 1, below the tenth level, has attained a length of 53 ft, and shows from 2½ to 3 ft of ore the whole distance, and now has 2 ft of excellent ore in the face. Fair progress is being made in the crosscut on the eleventh level; the face is now showing spots of fine chloride, and presents a promising appearance. The daily output of ore is about 65 tons, and is being handled well by mill No. 2, which is running steadily and doing good work. The bullion shipments amounted to $17,654.47 for the week ending November 30th, and aggregate $70,670.19 on November account, with one more shipment to be made.

MOUNT DIABLO.—The east drift from winze No. 1 is in 48 ft, and shows a foot of low-grade ore, with a streak of good ore in the face. An upraise from the east drift from the bottom of winze No. 3 shows small streaks of ore giving good assays. The east drift in the intermediate, between the second and third levels, and nearly above the winze, shows a small amount of $50 ore, while the west drift shows 19 inches of $60 ore in the roof of the drift. A raise has just been started on the ore body in the west drift from the Callison winze, and is showing some 12 inches of $60 ore. The winze on the ore from the north crosscut, in the eastern part of the first level, has developed some 8 inches of $60 ore.

COLLISEUM.—The drifts to the east and west from the winze below the shaft level are making good progress and showing valuable developments. The east drift is in a distance of 20 ft, and has opened a vein of fine ore 20 inches in width. The west drift has reached a length of 15 ft, the face being in a strong ledge formation carrying bunches of ore. The west drift on the shaft level is in 50 ft, and shows a favorable formation in the face, consisting of a ledge of low-grade ore 2 ft in width.

EUREKA DISTRICT.

WHAT THE MINES ARE DOING.—Eureka *Sentinel*, Dec. 2: The Price & Davis hoisting machinery has been taken down for removal to the Albion works. Thirty tons of ore shipped from the Williamsburg mine to the Eureka Con. furnaces realized $60 per ton. A batch of 30 tons of ore from the Phœnix mine, lately sent to the Eureka Con. furnaces, realized $80 per ton. The 150 level of the Matamoras is looking very well. The last shipment of ore from that mine was over 11 tons.

GALENA DISTRICT.

OLD THINGS SHALL BECOME NEW.—*Enterprise:* Some good ore is now being mined near Washoe Valley, in the old Galena district. These mines were opened as early as 1860, and a smelting furnace was at one time put up to work the ores taken from them. As the smelting operation proved a failure, the mines were shandoned. The ore now being taken out of the mines is rich enough to justify its shipment to California. The ore is an argentiferous galena. The smelter put up in the early days was after the pattern of those used in the lead mines of Galena, Illinois.

PINTO DISTRICT.

A FINE PROSPECT.—Eureka *Sentinel:* The Silver Nugget mine, in Pinto district, is showing up in good shape. It is being worked on a lease by Charles Rudeo and John Johnson, who have a nice streak of ore, averaging 2 ft wide, from which they have had assays made, running from $100 to $500 per ton. The tunnel is in 600 ft, but the ore is in a winze, about 100 ft from the surface.

PIOCHE DISTRICT.

A GOOD SHOWING.—Pioche *Record*, Nov. 25: The 10 tons of ore shipped from the black ledge of the Raymond & Ely mine, by Lazard Freres, to smelting works in Utah, it will be seen by the quarterly report upon mines, yielded $339.74. The black ledge is 40 ft wide, and, as the test of 10 tons prove, was certainly worth stealing, to say nothing of the mining machinery, mills, and $150,000 worth of tailings.

TUSCARORA DISTRICT.

BULLION.—*Times-Review*, Dec. 2: The Navajo Co. shipped this week 7 bars of bullion, valued at $13,755.78, and the Independent Co. shipped 2 bars, valued at $4,096 51, making a total for the week of $17,952 29.

NORTH BELLE ISLE.—*Times-Review*, Dec. 1: The new shaft has been sunk and timbered to the depth of 229 ft. Progress during the past week, 20 ft. The ground shows no material change.

BELLE ISLE.—Have made good progress with the drift on the west vein, 350 level. During the past week have extended it 24 ft. No change to note. Continue in the formation favorable for ore.

INDEPENDENCE.—West crosscut, 300 level, has made very little progress during the past week, the rock being hard and breaking badly. No. 1 shaft has been sunk 9 ft; total depth, 154 ft. The vein carries its usual width of fair milling ore. The stopes on the 300 level are not yielding as high grade as usual.

NAVAJO.—Crosscut, 450 level, has been extended only 6 ft during the week. Putting in a new pump and other work at the shaft has interfered with the work on this level. Crosscut is now out of the hard rock, and into the foot-wall porphyry, and is looking encouraging. The different stopes show no change, and continue to make their usual daily production.

ELRO CON.—For the past week very fair progress has been made. Stoping in drift No. 2 has been steadily prosecuted, and the ore obtained has been unusually good. The ledge still continues to produce an unusually fine quality of chloride ore, which gives an average assay of $130 per ton. The ledge still continues to range from – to 6 inches in width. Preparations for sinking and developing the ground at a greater depth will soon be commenced.

GRAND PRIZE AND ARGENTA.—Main shaft has had no work done on the bottom during the week, owing to a strong flow of water from the foot-wall ledge. This is pretty well drained now, and in a few days work will be resumed in the shaft.

WASHOE DISTRICT.

BEST & BELCHER.—*Enterprise*, Dec. 2: The north drift on the 2500 level is making the usual progress. The drift to connect with this from the 2500 level of the Con. Virginia has not yet been started. A good deal of water is flowing off in that direction, and it has been thought to be well to let the ground still drain out for a time.

OPHIR.—The joint Mexican winze, below the 2900 level, is being sunk at about the usual rate, but the ground breaks very "short" in blasting, owing to the predominance of quartz. The south drift on the 2900 level is going ahead about as usual, and good headway is making in putting in the new pumping gear.

UNION CONSOLIDATED.—The south drift on the 2900 level will connect with the northwest drift on the same level of the Mexican about the middle of next week. Other work in and about the mine is progressing as usual.

MEXICAN.—The joint Ophir winze below the 2900 level is making pretty fair progress, but the rock does not blast well. The northwest drift, on the 2900 level, will connect with the Union south drift about next Wednesday.

SIERRA NEVADA.—The crosscuts east and west on the 2700 level are both in a mixture of quartz, clay and porphyry, not materially different from that passed through by the main north and south drift.

CHOLLAR.—Good headway is making in the main south drift on the 2600 level. The material is vein porphyry, which is quite solid, and the flow of water from it is very small.

CALIFORNIA.—The joint Consolidated Virginia southeast drift on the 2700 level has been advanced 10 ft. Are still extracting ore from the croppings.

GOULD AND CURRY.—Are making good headway in the southwest drift of the 2500 level, following the diamond drill hole recently run. It is now about 650 ft in length.

HALE AND NORCROSS.—No work is being done in the drift on the 2600 level from the station at the C. N. S. shaft, owing to the strong indications of water.

YELLOW JACKET.—Are taking out about 40 tons of ore per day from the several old upper levels. The water no longer rises at the new shaft.

SCORPION.—Are still pushing forward the east drift on the 500 level in ground that shows but little change from day to day.

CROWN POINT.—Are still extracting a considerable amount of low-grade ore from the old upper levels.

NORTH GOULD AND CURRY.—Sinking the shaft progresses about as usual. The ground shows but little change.

BELCHER.—About the usual quantity and quality of ore is being taken out for reduction.

SUTRO TUNNEL.—Main tunnel, 10,500—retimbering the heavy ground at this point has been finished; also made some repairs at point 6,000. No work has been done in the south lateral since last report. Flow of water equal to 1,824,632 gallons per 24 hours.

ARIZONA.

LYNX CREEK.—*Arizona Miner*, Nov. 28: Mr. M. B. Tainter, a worthy miner and prospector from Lynx Creek district, dropped into the *Miner* office to-day and reports the outlook in that famed camp as exceedingly encouraging. The Howell smelting company are rushing things, and will ere long have their furnaces up and in operation. The recent cold snap has delayed the making of brick, but everything is now going ahead. Dr. Farnham is moving and putting up the 5-stamp mill which was erected in Turkey creek a couple of years ago by C. D. Brown. The last load of machinery arrived on the ground last night, and men are busy at work putting it in running order. Experts are examining a number of ledges for Cleveland parties, and in a short time sales at pretty large figures will be recorded. Two stores will soon be opened up on the creek, and will prove a great convenience to the miners of that section. C. Y. Shelton has received some very tempting offers for his mining properties on the creek, but none of which he considers high enough—$250,000 being the price he asks for his Eureka and several other well-known claims.

NOTES.—Prescott *Courier*, Dec. 4: Mr. Greenwell, superintendent of the Silver Belt, came in yesterday. He brings encouraging news from the mine and smelter. T. Roach continues taking rich silver rock out of the original Goodwin, Turkey Creek district. The Peck, Occident and Black Warrior, in Peck district, are all yielding rich ore. Capt. Eagan, who visited the district a couple of days ago, is highly pleased. Mr. Geo. F. Stoddard, just from the Copper Mountain mine, says the property is bigger and richer than ever. A smelter will soon be erected. Over 600 tons of first-class ore has been taken out of the mine in less than three months. Mr. A. W. Callen is in town from Walnut Grove district, where he is opening some good mines. Mr. Morgan, one of the owners of the "Lost" mine, Turkey Creek district, exhibits ore which carries ruby silver, horn silver and native silver.

MINING INTERESTS TRIBUTARY TO PHŒNIX.—*Herald*, Dec. 2: The Humbug group of lodes lie in the southern part of Yavapai, and are too numerous to be named individually. They are owned by Mr. Feely and others. These lodes have more real developments than any other group of mines in this part of Yavapai county, and are again coming up and will shortly, without doubt, soon figure as one of the most important mining camps of central Arizona. Mr. Feely, we are credibly informed, went into Humbug with a small stock of provisions and two hits in cash, and his partners were in no better circumstances, yet they have managed to make a living from their claims by the use of a Mexican arastra for 4 or 5 years, and to do several thousand dollars worth of work on other claims by way of developmeot in sinking shafts and driving tunnels. The mines are, therefore, well developed. Some of them are silver bearing and some gold bearing, but most of them produce both metals.

THE STOCKADE.—At this mine, just above the junction of Stiff creek with the Humbug, there are 6 or 7 arastras running and all paying well. At this point quite a camp is springing up. Here also Mr. Frank Ryland is working on the Southern Belle, a large lode of white quartz containing free gold in sufficient quantities to pay well to arastra it. Three other parties, so we are informed, are running an arastra on gold-bearing quartz on the head waters of the northeast branch of Castle creek, and are said to be doing very well indeed.

COLORADO.

THE HORSESHOE.—Georgetown *Courier*, Dec. 2: H. R. Bunnell came over from the Horseshoe, at the head of Peru gulch, last week, and reports more mining being done in that section than in any previous winter.

THE PAYMASTER.—At this mine a contract has been let to sink the shaft deeper, and quite a force of men will be worked all winter. They have a large body of ore in the shaft, and the grade of it is much better than it was near the surface, late assays showing about 150 ozs of silver to the ton and a large percentage of lead.

THE SILVER LEDGE.—It is being worked steadily by a force of 8 or 10 men, and has improved materially in appearance since last summer. It is now looking better by far than at any previous time. A few men are working on the lodes of the Horseshoe Co., but no definite information had been received from them. Arrangements have been made for them to work steadily all winter.

DISCOVERY.—The latest excitement in Peru district is the discovery of what is believed to be the eastern extension of the Delaware mine. The discovery was made in Cinnamon gulch, about 150 ft below the claim patented as the Deleware extension. In sinking 10 ft the discoverers uncovered a vein of solid smelting ore, 6 inches thick, that assays 200 ozs per ton.

THE GLENDALE.—This mine, at the head of Warden gulch, is producing satisfactorily. It is owned by J. B. Cleveland & Co., who are taking out ore that mills from 700 to 1,400 ozs of silver to the ton.

ATTACHED.—The stamp mill of the Midas company, the New Orleans company that recently commenced operations in the vicinity of Idaho Springs and Black Hawk was attached last week by McFarland Bros., of Central, for work done.

THE HARDSCRABBLE GROUP.—This Hardscrabbls group of mines, on Hanna mountain, under the management of Wm. M. Pinckard, have been developed steadily since July 5th. The tunnel on the Hardscrabbls lode is in 350 ft, with car and track, and shows considerable scattered copper and galena. The tunnel has intersected the Avalanche lode at a depth of over 200 ft, and a level has been started upon it. The crevice where intersected shows copper and galena, and the indications for reaching pay are considered excellent.

QUARTZ.—A vein of quartz carrying very rich ore scattered in it has made its appearance in the breast of the adit on the Edinboro lode, situated on the ridge that comes down Republican mountain directly east of Goodhope gulch. This adit has been driven 230 ft, the headway being at present about 75 ft below the surface. The lode is owned by Drs. Bradley & Hartmann.

THE MURPHY.—A ton of ore from this mine was milled last week which gave a return of 13 ozs of gold. This lode is situated on Silver mountain above Empire, and is worked by Harvey & Mont Cowles.

THE new reduction works at Decatur probably will start before the first of next May. They will be completed before that time, but there will be difficulty in getting ors down from the mines until a large portion of the snow has disappeared.

IDAHO.

PROPER MINING.—Ketchum *Keystone*, Nov. 24: The Wolftone mine, on Deer creek, will probably go into more extensive operation during the winter than any other mine in the vicinity. Capt. Berry, the superintendent, was in town during the week, and we learn that his intention is to employ a constant working force of 20 men throughout this winter, going into the ground for what it is worth. There are at present about 500 tons of good ors on the dump of this mine, and no doubt this quantity will by the coming season be greatly increased. All this ore is awaiting a more profitable market looked for with the railroad completion, and inasmuch as it can find no home market at the present time, we can but admire this style of management. It is one of the very few instances in this country where capital operations have been begun for what the ground contains rather than mere speculation, and, as in every one of those instances, has produced handsomely from the start.

MONTANA.

EXCITEMENT.—Butte *Miner*, Nov. 29: It is reported that rich gold and silver-bearing quartz has been struck in Kicking Horse pass, in the Selkirk range. Specimens have assayed $90 to the ton. Great excitement prevails in Kootenai.

THE Bismarck and Von Armin mines that have laid dormant since the demise of the People's National bank, are to be opened up again. These mines contain rich ores, and will prove a valuable addition to the cordon of rich mines in Jefferson mining district.

A NEW mill is under contract for the Providence M. Co. on their gold lead near Lincoln, Deer Lodge county. Part of the Penobscot mill has been purchased for this purpose, and it is expected that the mill will be in operation February 1, 1883. The Providence lead prospects well, showing 6 ft of gold-bearing quartz, and is owned by Helena capitalists.

MAIDEN expects a boom next season. The Hauser & Co. mill is now in operation, and work in the mines is going right ahead. Having become the owner of a number of other leads in different localities, in six months' time this company will have done a great deal in the way of developing the camp. Work on the Collar mine is progressing favorably. The tunnel, which is nearing completion, will tap the vein nearly 200 ft below the surface. Mill machinery for working the ores will be erected early in the spring. There is no question but that the mines are good, and now that capitalists are taking hold to work them, Maiden cannot fail to enjoy a business prosperity equal to any other camp of its age in the Territory.

THE SILVER BOW PROPERTIES.—*Inter-Mountain*, Nov. 28: The silver mines of the Silver Bow Co. are in progress of active development, and the results are most satisfactory. The main ore supply for the mill, which is kept in continuous operation, is taken mainly from the Belle of Butte and La Plata, but the company has at least five other properties which could be made very productive were the capacity of one mill large enough to warrant their development. The Belle of Butte, which has ranked as one of the leading mines of the district ever since the discovery of the immense ore shoot—12 ft wide—in the west 160 level, is now being worked at a considerable depth, and is looking even better than the owners anticipated.....In the La Plata, while the vein is not so compact as in the Belle of Butte, the ore is much richer and the property is paying handsomely. Work is chiefly confined to the extension of the 200-ft east drift, which has penetrated the ledge for a distance of 250 ft on a seam of ore varying in width from 2½ to 3 ft. It assays from $100 to $250 in silver, and carries from $25 to $40 in gold per ton. About 10 tons of ore is the daily product, which, like that of the Belle of Butte, can be heavily increased at the pleasure of the company.....Operations have been actively resumed on the Gray Rock, which, two years ago, was one of the heaviest producers in the district, and which, in the west shaft, at a depth of 92 ft, showed a 24 ft breast of ore. Last year a new 3-compartment shaft was started and sunk to a depth of 300 ft, but the vein took an eccentric and unexpected turn and the shaft is not now being utilized. A new shaft, however, has been started at a point 250 ft east of the one mentioned. It is 115 ft deep, and a north crosscut will be started when it shall attain the depth of 150 ft. It is considered certain that the old vein will be tapped and that the big chute will be recovered.

THE CLEAR GRIT.—*Inter-Mountain*, Dec. 2: The Clear Grit is now producing some of the highest grade silver-copper ore ever extracted in the district. The west 217-ft drift on the south or hanging wall ledge shows 3 ft of very high-grade rock, and Supt. Kessler says no time will be lost in erecting a smelter next spring. There is no longer a doubt as to the productive capacity of the property.

BULLION SHIPMENTS.—The bullion shipments reported from the express office last month are the heaviest ever known in the history of the camp, being considerably over $350,000.

UTAH.

ORE.—Salt Lake *Tribune*, Dec. 3: Ore is being shipped from the Cottonwood Chief mine, located in the Cottonwood canyon, Weber valley, to the Park City smelter. It is hauled to Peterson on the Union Pacific and sent forward by rail. This ore is a good quality of iron for fluxing, and contains some silver. The shipments began last week, and we are told 8 or 10 carloads were shipped during the week.

THE EMPIRE.—This mine, at Park City, started about two weeks ago to sink the shaft from the 400 level to the 500 level. They are now getting good ore out of the winze between the 300 and 400 level, and have also plenty of splendid rock in the west drift on the 400 level. They employ 60 men and expect to push work vigorously to open all the levels.

GOOD.—Southern Utah *Times*, Dec. 2: Stewart mine No. 2 is running very successfully and producing considerable gold bullion. The furnace of the American Antimony mine, Antimony City, Garfield county, is finished. Ontario is quoted in New York at $35.75 to $37; Horn Silver, $7.50; Calumet & Hecla, $249, and the Ontario promises to be as permanent. The Provo *Enquirer* underatands that the Beck and Bullion mine in Tintic is developing most satisfactorily to the owner, Mr. John Beck, of Lehi. Upwards of 100,000 tons of ore is in sight that carries 25 per cent lead and 25 ozs silver. At Silver Reef the Barbee & Walker Co.'s mill and mine were attached by Gillespie, Lund & Co. on November 25th. It is a valuable property, and the workmen and other creditors will get their full pay without doubt. Marshal J. R. Lindsay has the property in charge.

The Measurement of Air in Mines.

At a meeting of the Manchester Geological Society held in Wigan, the measurement of air in mines was brought forward for consideration hy Mr. J. Thompson, who read a paper on the subject. Of late years, he said, there had been no unsparing use of capital in providing the most efficient appliances for producing the enormous volumes of air now passed through the mines, and in an abstract sense it might perhaps he considered that, in providing such powerful means of ventilation, the duty of the mine owner had been abundantly discharged, and that at this point the duty of the officials began in seeing that the useful effect intended hy the erection of these appliances was constantly attained. It could not he refuted that one of the most important functions of a colliery manager, in a general sense, was a careful observation of the operations of such forces as were known to have a tendency to influence the quantity or volume of air in circulation within the mine. The means at present in operation for making such observations must, however, be regarded as very equivocal, and consequently of an unsatisfactory character. A much greater value would attach to observations of all instruments, if these observations were made simultaneously, at fixed periods during each day, but before such could he possible it was manifestly necessary that some superior form of anemometer must he adopted, and the observations of its indications rendered as easy as were those of other instruments. The importance in a practical sense of being constantly able to indicate in the office at the surface, the quantity of air passing through a mine, and in a scientific sense of the simultaneous system of making all observations, could not he exaggerated. With the increased responsibility imposed upon mine owners hy recent legislation, there was a constantly growing necessity for increased watchfulness in all respects, particularly on the important question of ventilation; and the means he would propose for indicating at one point the velocity of the air current at some other point, was not the result of any new or important discovery, hut simply an adaptation or combination of well known principles. In the first place he would adopt, in the place of the usual anemometers used underground, what were well known in meteorological circles as Robinson's cups, which were now used at nearly all the Board of Trade stations for indicating the speed of the wind. Instead, however, of the clock-work arrangement which registered in miles the wind that had passed, he would cause every revolution made hy the cups to break an electric circuit, to the scope of which there was of course no practical limit. This would be accomplished hy a simple mechanical arrangement connected with the axle of the cups, and an electric armature so arranged that the circuit was complete only each revolution of the cups a sufficient time to actuate a small "dead-beat" hammer upon a surface of porcelain or glass at the observing station. This hammer and its accompanying apparatus would he enclosed in a wooden box, only a few inches square, the lid of which would have an attached crank or switch to make and break the electric circuit a second time as the lid was opened or closed. By this means the entire apparatus would he completely free from electric influences, except during the short time occupied in taking observations. The number of beats given hy the hammer in one minute, or the average of a number of minutes representing the number of revolutions of the cups per minute being ascertained, and the ratio of the speed of the cups to the true velocity of the wind, as well as the superficial area of the stations of the cups being known, the number of cubic feet per minute of air passing that point was readily ascertained by a process of calculation as simple as was the case with other forms of the anemometer. Tables, if desired, could he easily drawn up to facilitate calculations, whilst the electric circle would permit the establishment of a number of observing stations upon it, and in the absence of such stations below ground, it would he generally found practicable hy counting the revolutions of the cups themselves to form some general comparative estimate of the quantity of air passing. The method of the erection of the cups at the selected stations within the mine was a matter which obviously would he governed hy circumstances, but the small space occupied hy the apparatus would involve no serious difficulty in any case. Taking into consideration the constant liability to changes in matters affecting the ventilation of mines, the receiving one day an account of the quantity of air which was circulating 24 hours previously must manifestly be of little immediate practical use. The important question was the ability to ascertain what was going on in the mine at any moment, and the apparatus he had described would he always ready to answer that important question. It would also enable a constant check to he kept upon those who had charge of the ventilating machinery, and was less liable to get out of order than most other forms of anemometer.

BESSEMER WORKS IN THIS COUNTRY.—There are now said to he in the United States 15 Bessemer steel works, with 37 converters, that are capable of producing in the neighborhood of 2,000,000 tons of Bessemer steel annually.

Forest Trees of California.*

Heavy Yellow Pine.

(Pinus Ponderosa.)

"There is a quiet poetic spirit here, amid
The silent majesty of these deep woods—
Its presence shall uplift thy thoughts from earth,
As to the sunshine and the pure bright air,
Their tops—the green trees lift."—*Longfellow.*

The yellow ponderous pine of California and Oregon covers vast areas of several thousands of miles in extent, from beyond the Columbia river to Mexico, and from Coast range to Sierra mountains, with the most magnificent forests, not only mixed with other pines, firs, spruces and varied aborea, hut still maintaining its prevailing character; it also often becomes the only species the traveler may meet for days together, especially in the arid and burning interior valleys and basins, and even here it is often a large tree, *i. e.*, over 100 ft. high, suffering somewhat in the character of the lumber, which then becomes softer, lighter, and is greatly given to an ungainly warping propensity that seems simply ridiculous, when posing to such extremes. Like most other trees, the quality of the timber is exceedingly variable, according to soils and surroundings. To illustrate and confirm this remark, we will state that a dwarf variety, or rather subvariety of *Jeffreyi*, in Owen's valley, at "Casa Diablo," bearing cones barely one-half the usual size, within reach from the ground—the full grown tree but little higher than one's head—with glaucous sour foliage of the taste of common rhubarb or sorrel. At first view, we took this remarkable example to be a new species of pine, but upon more close and careful examination, although growing upon exactly the same level and within a few stone-throws of typical trees over a hundred feet high, yet this dwarfed character seemed evidently due to the soil in which this particular group grew, being a saline deposit from a hot spring, forming a little knoll whence the mineral waters had receded in course of formation.

The ever-increasing import of all our varied Pacific observations tends to impress upon us the vast significance of foundation soil—as to accelerate or depressive, qualatative or quantitative, and other influences upon arboration, or the lesser and more general vegetation—many fingered facts point continually to the ultimate mineral and moraine as their great guiding genius; so the lesser mineral flows to the lasts and leasts, æreal and ethereal; a thousand witnesses rapidly multiplying, crowd to the front and clamor for recognition and application to human use, or to use and to humanity. The artificial dwarfing of trees hy the Japanese—a former mistery, now generally known—practiced hy myself when a boy, viz: By the layering principle, modifiedly applied, from upon trees already very old, hy partially and successively continuing to helt or girdle a twig while the limb is wound round hy turf or moss with a suspended water drip until it strikes radicles, and then cut off and potted or planted. This pine, from 100 to 300 ft. high, and from three to eight feet in diameter, is, for nobility of port and lofty beauty, in the eye of the cultivated stranger, possessed of unusual interest; the finest forests are but little removed from the great *sequoias* themselves; this comparative contrast is most vividly brought home to one's consciousness hy their often skirting, and as it were, guarding the regions round about them; nor is it always their grandeur alone that so impresses, for to be duly appreciated we must enter into the spirit of the tree itself in various ways, must catch the silvery thrill that so nervously and finely trills over the long radiating turfs of steely needles, that tip and aspergil the older heady-scarred boughs; and then there are those large, long plumes of younger spire-topped trees, which are altogether alive to one who

"Loves the wind among the branches."

Through the palisaded pine trees—ever sighing—ever sighing as they softly gleam o'er the landscape, tinted, too, with the most delicate possible tinge of golden-green that glimmers a softer sheen over the sunlit hair—these coma almost hiding the clustered cones that tip the final twigs. The bark is peculiarly striking, of bright yellowish-brown, and of lamellated soft corky character and color, its surface laid off in large, flat, smooth plates from 4 to 10 inches long or so, one-third to one-half less broad; these oblong divisions, for the most part, follow the law of cell forms and forces combined, bounding the chinky water-lines, the leading channels of which are somewhat deepened below. The ease with which jayhirds and woodpeckere honeycomb their thimble-sized holes and drive in their winter supply of acorns, point or germ end foremost, renders the bark of these pines the preferred repositories; even bushels of acorns are sometimes seen so stored in a single tree. As the germ end is thus kept dry, and hy pressure quite prevented from swelling, it cannot germinate, although some species are so prone to sprout they scarce wait until the fall to the ground, and never long after—a hint to the wise is sufficient.

Although this far Western yellow pine comes in second above Sabin's gray pine as we ascend the Sierras, and is very abundant and of the best types on the higher ranges, more especially east, yet it is also a Coast Range pine. In this latter region the cones are much smaller, seldom over three or four inches long hy two to two and a half inches broad, and the brown seed, although rounder and not so sharp, is about the size of apple seed. Whereas, the *Jeffrey's* form (hy some considered a good distinct species, certainly a quite characteristic variety for the culturist), found at middle and higher altitudes, has cones at least three or four times as large, from six to eight inches long, hy four to six broad, old straw beehive shape, and striped or variegated, seeds twice the size. Where transient mountain streams lave the roots, and perhaps other conditions favoring, the cones are often more elongated or not so strictly ovate-conic—this we take to be the *Beardsley* variation—and so others besides the extremes one sees beneath every tree, but the general resemblance of the several synonyms of the type is such that it may warrant their union into one species, even if we reckon them eminent and choice varieties. Some of these majestic trees, 75 to 100 or 150 ft. high, are found with massive spreading branches of peculiar aspect, unwonted among pines; but for the most part, this species is towering, lofty, and clean colonaded below, hence its availability as timber for manifold economic uses. In a brief historic point of view, as connected with this pine, it may be well to note the import of those little basins or ring-ridges of sand so often seen encircling the base of these pines. It is the work of the Indian—designed to entrap and collect the fat, luxurious worms that infest these trees—who, firing the straw on the still air of late summer and early autumn, the rising smoke among the boughs offending them, they let go, swinging down to the ground, whence they betake to the trees again, and, falling into these pits, their futile hold upon the treacherous sandy margin, causing a continual backward tumble into the bottom of these shallow pits; thence the squaw gathers them into baskets for food; thus a double purpose is subserved; that also of cleaning the ground preparatory to the fall of seed. In allusion to the pine, the native, in a metaphoric sense, often unwittingly bears the highest testimony to his great estimation, judging from their highly figurative style of speech, graphic force, great eloquence and pathos of many tribes of North America. We say, judging from his choice of words and figures, his wild woods and high mountain home must have for him still much genuine poetic charm; perchance sounder significance than the pale face is wont to perceive akin to, if not the real relic of a lost Eden of some celestial bygone. Take as an example the Chief Saginaw, when asked of his welfare and that of his family (two lovely daughters, meanwhile having died), characteristically answered (pathetically breaking a long, fixed, statute-like gaze of silent retrospection): "Saginaw? Saginaw was once a tall pine among saplings of the forest! The pale faces came and sold him fire-water; he became depraved; the Great Spirit's anger was kindled against him, and His lightning struck away his branches!" Long may they wave their fadeless banners aloft to the pure mountain breezes, and sing their sweet æolian spirit song to entranced and fondly listening ears, soothing the soul to peace and to inner contemplation.

This ponderous Pacific pine is so called from its great weight, the timber being unusually heavy from its dense, generally resinous, often hard and brittle character, although, as before observed, softer and tougher in the middle Alpine belt of about 6,000 ft. or more. Wood usually yellowish, largely appropriated to mining, building in general, and for a great variety of useful purposes, among the best timbers of the Pacific.

This tree, like the long leaf pine (*P. Australis*) of the south, to which it bears strong resemblance in general appearance, is rather more apt to be blown over hy high winds than most other pines of this coast.

---

* From "The Forest Trees of California," by A. Kellogg; published by the State Mining Bureau. State Printing Office, Sacramento, 1882.

Report of the Arid Lands Commission.

We have received an early copy of the report of the "Arid Lands Commission," popularly so called, but more particularly a "report on the climatic and agricultural features and the agricultural practice and needs of the arid regions of the Pacific slope, with notes on Arizona and New Mexico, made, under the direction of the Commissioner of Agriculture, hy E. W. Hilgard, T. C. Jones and R. W. Furnas."

This document has been long awaited, and we are pleased to find that it contains much which it will be to the advantage of the State to have generally known at the East. Ex-Governor Furnas and Judge T. C. Jones are gentlemen well known at the East, and their comments upon what they saw here will be received and believed when the *exparte* statements of a Californian would be questioned. We find in the observations of the Eastern members of the Commission many remarks which show them to be close observers and fair judges, and we expect to transfer to our columns, from time to time, parts of their reports. In this issue we give Judge Jones' report upon California horses.

The Chairman of the Commission, Prof. Hilgard, contributes to the report many pages of excellent information upon California climates, soils and special industries, and it cannot be doubted that California will be much better understood at the East when the document is generally circulated. In the printing of the report hy the Government printers there have grievous omissions occurred in not crediting each member of the Commission with his individual work. Prof. Hilgard calls our attention to the following list of errata regarding authorship, which are serious: Page 92. All the matter from the heading "Sugar Cane and Sorghum" to the heading on page 98 should be credited to E. W. Hilgard. Page 98. All from heading "Horticulture and Viticulture" to page 107 inclusive should be credited to R. W. Furnas. Page 125. All from end of paragraph headed "Small Fruits" (being the discussion of citrus fruits) to heading on page 128 should be credited to E. W. Hilgard. All from that heading to page 137 to R. W. Furnas. Pages 152 and 153 ("Insect Pests") should be credited to R. W. Furnas.

We presume that copies of this report can be had on application to the Commissioner of Agriculture, at Washington, or to the Congressional representatives in each district.

Dispelling Illusions.

In the Toledo *Blade*, that well-known humorist, D. R. Locke, writes with becoming gravity on the above topic, in its application to a very common experience in our fast American life:

"What Western man is there who, after a stay in the new West of 10 or a dozen years, did not go back to his old home in Massachusetts or New York with great anticipations of pleasure? He dreamed of it for months before starting, and he made careful preparations to make the stay at 'the old place' a long one. He called to mind the Jims and Toms and Susies and Marys of his boyhood, and thought how delightful it would be to meet them. He remembered Sloan's pond, where he fished when a boy, the mill on the creek from the pond of which he had pulled so many bull-heads, the hill which every winter of his boyhood had been his resort with his sled, the old red schoolhouse, every orchard and watermelon patch he had robbed came freshly before him. His blood coursed quicker as the train moved into the station (it was a stage-coach in his day), and he was in the seventh heaven of expected pleasure by the time he had got to his mother's house.

"Disappointment of a most sickening kind followed. One Jim was in Wisconsin, another was lying in the graveyard. The village itself had changed so that he could not recognize it. The old Eagle Tavern was gone, and in its place was the Union Hotel. Peck's store, with the village doctor and justice of the peace sitting in front, was not there, but in its stead a huge block of brick buildings. The railroad had given the village a start, and it was about the same as the one he had left in the West. The woods had all been cut off the hills and Sloan'e pond in consequence had dried up, the mill had been torn down long ago; and the very river had shrunk. Possibly it was as large as ever, but men's eyes were different from boy'e eyes. Round hill wasn't exactly the shape of a sugar loaf, as he had always had it in his mind, and the laughing, romping, red-cheeked Susies and Marys of his boyhood he found staid, sober, worn matrons, with other Susies and Marys to care for. And when Tom came to him he found him not a rosy-cheeked boy with his trowsers hanging by one suspender, but a tall, hearded man, who had but a minute to give him. Jim, the most promising boy in the village school, and the prize scholar in the Sabbath-school, who was intended for the ministry, he found a blear-eyed loafer, hanging about the gin mills (in his day root beer was the only beverage sold in the village), and Sam, the stupidest boy in school, was the principal lawyer in the county, and was being talked of for Congress.

"And to add to his trouble, the dishes cooked by his mother, of which he had been so fond when a boy, tasted entirely different, and so he told the good old lady, and she replied, with a sigh:

"'I cook it just as I used to, but you must remember there is a difference between a boy of 14, who can relish anything, and a man of 30. You have changed—not I.'

"And so instead of making a long stay, he found the place unendurable, and packed his valise and went home at the end of the third day."

REDUCTION WORKS.—Being now thoroughly convinced that Prescott will soon be connected by rail with the Atlantic & Pacific railroad, and, perhaps, with the Southern Pacific, we again urge capitalists to come here and erect complete quartz reduction works. Our citizens will do everything in their power by way of assisting whatever company may start the enterprise. Excellent sites for furnaces, etc., exist below and above Prescott on Granite creek. Water is abundant, fuel is cheap, and prices of labor, etc., are not high. The town is favorably located for a general business of this kind. It is lower than the mines, hence quartz would not have to be transported up hill. We really believe that the inducements offered by the town and surrounding country cannot be equaled on this coast.—*Prescott Courier.*

PHOSPHOR-BRONZE SLIDE VALVES.—A pair of phosphor-bronze slide valves which had been in service for a considerable length of time, were among the many interesting exhibits at the recent exhibition at Tynemouth, England. They were taken from an express engine of the North-eastern Railway Co. after six and one-half years' working, during which time the engine made a mileage of 261,182 miles. The original thickness of the slides was one inch, and when exhibited they were five-eighths inch thick, and at a fair estimate from their present condition, it is thought that they are capable of from three to three and one-half years' further work.

The Engineer.

Narrow-Gauge Railroads.

We believe it is not generally known to what a large extent the system of narrow-gauge railroads is being extended in this country. It is a fact that one of the greatest railroad systems in the world is the narrow-gauge railroad belonging to the Boston combination, the same being practically 10,000 miles under one management. The road is three feet standard, and is owned in part by the men who built and still run the Atchison, Topeka and Santa Fe road.

These 10,000 miles comprise the pioneer Denver and Rio Grande, sleeping in its combinations California to Utah; thence, first east to Denver, Colorado; from that initial point south through Pueblo to Trinidad; spurting westward from between those two points through and over into the San Juan country, with its vast wealth of gold and silver; and again south into New Mexico, connecting with the Pasamore system of Texas and the Palmer-Sullivan route to the City of Mexico. In the course of a few weeks the last link connecting the Toledo, Cincinnati and St. Louis and the Cotton Belt narrow-gauge will be finished, comprising 1,000 miles of road almost unknown to newspapers.

The party of Massachusetts capitalists—some 45—who left Boston a few weeks ago to take a trip over the route, have recently returned, and voted among themselves to raise $800,000 to complete the connecting link, that sum of money having been found necessary in order to save certain large grants. The party represented the *creme de la creme* of Eastern capitalists, who are at the present time constructing the Mexican Central with its inter-oceanic branches, and the Atlantic and Pacific from Albuquerque, New Mexico, to San Francisco, and who are also the officers and principal stockholders of the Toledo, Cincinnati and St. Louis narrow-gauge, a system of 820 miles of road. The connection of this road at East St. Louis with the St. Louis and Cairo narrow-gauge forms a connection on the shores of the great chain of lakes at Toledo. This narrow-gauge system of the United States has, it appears, been weaving a network of lines in an unostentatious and quiet way, and when all the gaps are closed up it will open up 10,000 miles of narrow-gauge track. Vanderbilt or Gould may well be surprised at this New England movement.

UNSINKABLE STEEL SHIPS.—Unsinkable ships, according to Capt. R. B. Forbes, of Boston, will, in a few years, carry all the first-class goods and first-class passengers between Europe and the United States. He supposes these ships to be built of steel and to be divided into at least 10 compartments, exclusive of those occupied by machinery and fuel; every compartment to have the means of pumping in air and pumping out water. Such a ship could not very well sink, but if, as an additional security, all the freight was secured in water-tight packages, the vessel would float even if every one of the compartments had a fracture in it. There is nothing absurd in this supposition. It is more than probable that all heavy and coarse merchandise, such as metals and soda ash, will be excluded from the fast mail and passenger steamers. It will only be necessary, in that case, to see that the compartments of the two lower decks are without defect, and to introduce a complete system of pumps for air and water, and thus adopt the old Chinese method of packing silks and teas, using either casks or metallic coverings so far as practicable. The hazards of an ocean voyage will be reduced to a minimum, but no safety can be guaranteed where steamers are run ashore, as too often happens.

CARS ON THE BROOKLYN BRIDGE.—The distance between the piers of the Brooklyn bridge is 1,600 ft. The number of cars ordered for use on the bridge is 48, the seating capacity of each car to be 46 persons. The rate of speed is to be 10 miles an hour, so that the time between the piers will be nearly two minutes. Each train is to consist of three cars, thus carrying 138 persons at a trip. Certainly the trains cannot run at intervals of less than one minute, so that the capacity of the bridge for railway traffic will be, in round numbers, 150 people a minute each way, or 9,000 persons an hour. The Trustees will do well to consider these statistics before proceeding with their present plans. If the bridge meets the demands of the public, it will have a capacity of several times 9,000 railway passengers an hour each way.—*Ex.*

ANOTHER TALL BUILDING.—Another addition to the high buildings of New York will shortly be finished. The Wellee building, on Broadway and Beaver street, 10 stories high, is constructed in pink granite, in the renaissance style. The entrance on Broadway is of striking proportions, being lined with gray polished marble. The passages are paved with Spanish tiles, and wainscoted in colored marbles. The cost of the site has been $200,000, or equal to $14 50 per square foot. Nearly two-thirds of the entire space has been sacrificed to the requirements of light and air, which are excellent throughout the building. There are four elevators, one capable of raising heavy weights. The building possesses its own artesian well, sunk over 1,000 feet in the bedrock.

Useful Information.

Fire-Proof Cement.

A fire-proof cement is made from a newly discovered material found in the Elfel mountains, near Wiesbaden, Germany. It is alleged by eminent professional men to be the only material of this kind which possesses, besides its plastic qualities, the virtue of being fire-proof. Moistened with water, this cement forms an elastic mass, which can be exposed, when dry, to great heat without shrinking or showing any cracks. The mode of its preparation is as follows: The cement is to be well mixed in a dry state; a small quantity of water is added and mixed well together. As a mortar it can be used in the ordinary way. In lining furnaces, however, care must be taken to press the cement well into the walls, so as to leave a smooth, even surface, as when dried by the air the cement easily crumbles, and will not harden till ignited. Moreover, it must not be treated roughly until it has been well burnt. Cracks in furnaces, retorts, etc., should be well cleansed and scraped, and, if possible, roughed, before applying the cement. The parts to be mended should be dampened beforehand. An analysis by Dr. Bischoff, of Wiesbaden, gives the following results: The cement is a pale gray, gritty substance, consisting of a good deal of fine dust, with angular and round particles of quartz. When mixed with water it is very sticky, compact and easily molded. In 100 parts of the material, dried at 120° C., there were:

Clay earth	10.18
Silica, chemically combined	11.03
Silica, mechanically mixed sand	73.58
Iron oxide	0.41
Lime	0.23
Magnesia	0.17
Potassa	0.99
Loss by heat	3.46
	100.05

As will be seen, the quantity of fusible matter, such as iron, etc., is very small indeed, if any. Under the fire treatment the cement showed the following results: After being heated to silver-smelting heat, or about 1,000° C., the cement turned to a gray color, speckled with a few black spots, the fracture being earthy and porous.

SHEET BARRELS.—The Michigan concern that makes sheet barrels has machinery for cutting the logs into barrel lengths, softening the wood by steaming, and then shaving each piece into a long sheet, unrolled like a carpet. Each sheet is then cross-cut into such a length that when the two ends are brought together it has the size and form of a barrel without heads. The improvement over the stave barrel is great in cost and utility. The great drawback to manufacture is that clear lumber is required, knotty stuff being rejected. The staveless barrel factories on Puget Sound use cottonwood, of which there is an abundance that is suitable.

PUTTING ON KID GLOVES.—It may be of interest to some of our lady readers to learn that if kid gloves are laid upon a damp towel for two or three minutes they will go on with less chance of tearing. A glove manufacturer advises that the upper part of a mousquetaire glove be turned down beyond the button, and when the fingers and hand are worked in the top may be carefully turned but not pulled back.

OIL ON THE WATER.—The authorities of Aberdeen, Scotland, have decided to place perforated pipes on the bar at the entrance of that port, by which oil can be forced into the water, for the purpose reducing the force of the waves and smoothing the surface of the water during storms. This will be the second ocean port they propose to render the passage of shipping to and from the harbor more smooth during storms.

THE CAPE COD CANAL TO BE BUILT.—Capt. Nathan Appleton, a well-known Boston capitalist, states De Lesseps and General Turn, the Hungarian canal builder, will be interested with him in building a ship canal across Cape Cod. The application is on file in the State House to complete the job in three years, with $2,000,000 expenditure.

THE WASTE OF WILD COCOONS gathered in the woods of China, Japan and Australia, is made into a felt one-half the size of hair felt, and is used for the manufacture of hats and for furnishing purposes. It has the peculiar bright color of silk, and is sometimes used with hair, wool, cotton and other substances.

STRENGTH OF INSECTS.—In his experiments with the strength of insects, Plateau, the French naturalist, has ascertained that, in proportion to its size, a June-bug is as powerful as a locomotive.

AT THE MILAN EXHIBITION a solid wine was introduced. It was in the form of a paste, which, when, dissolved in a glass of water, was said to yield instantly a generous wine of good appearance and bouquet.

SEVERAL PLANS.—To get rid of the objectionable odor of paint in a chamber or living-room, slice a few onions and put them in a pail of water in the center of the room; close the doors, leave the window open a little, and in a few hours the disagreeable smell will have almost gone. Another method is to plunge a handful of hay into a pailful of water, and let it stand in a newly-painted room over night; this plan is also effectual. The foregoing have the important advantage of being simple remedies, as the necessary materials are always obtainable. Yet another plan, but it is rather more complicated: Place a grate of lighted charcoal on a piece of flag or slate in the center of the room, and throw on it a handful of juniper berries; shut out all ventilation from the room for 24 hours; the doors and windows can then be opened, when it will be found that the nasty, sickly smell of paint has entirely gone. The furniture may be left in the room during the process, and none of it will be injured.

CORK COVERING FOR BOILERS.—At the Nurnberg Exhibition was shown a novel use of bricks of cork. These bricks have hitherto been only used for building purposes, on account of their lightness and isolating properties; but they are now also employed as a covering for boilers, and are said to excel even asbestos in preventing the radiation of heat. They are stated to be very cheap, being prepared of small cork refuse and isolating cement. At Nurnberg the application of cork bricks was largely shown. The size of cork bricks is 10 by 4½ by 2½ inches.

A CHEAP VARNISH.—A brilliant black can, it is said, be produced on iron and steel by applying with a fine hair brush a mixture of turpentine and sulphur boiled together. When the turpentine evaporates there remains on the metal a thin layer of sulphur, which unites closely with the iron when heated for a time over a spirit or gas flame. This varnish protects the metal perfectly, and is quite durable.

PRESERVATION OF HONEY.—Honey, according to A. Vogel, contains on an average one per cent of formic acid. Observing that crude honey keeps better than that which has been clarified, E. Mylius has tried the addition of formic acid, and found that it prevents fermentation without impairing the flavor of the honey.

Good Health.

How Milk is Made.

That the animal organism is capable, under certain conditions, of converting various good elements into milk is one of the most familiar facts of nature. How the milk-producing glands perform their work remains to a great extent a puzzle. The later investigations and theories in this connection are clearly set forth by Dr. G. C. Caldwell in a recent issue of the New York *Weekly Tribune*, in answer to the question, "How is milk made?" He says:

The essential milk-producing part of the udder is made up of a series of ducts or tubes branching out from reservoirs at the heads of the teats, joining one another at little sub-reservoirs, and separating and uniting again, till finally they end within minute organs called vesicles or follicles. Both Dr. Stuttevant, of the New York Experiment Station, and Mr. Arnold have traced these ducts to their sources. These follicles are the fountain heads whence the milk is collected by the ducts and carried through one reservoir after another to the teat.

The three essential ingredients of the milk, besides the water, are the fat, in the form of minute globules suspended in the liquid; the casein, partly in solution in the water of the milk, and partly in solid grains suspended in the liquid; and the sugar, only in solution. Nearly all authorities agree that the formation of the milk is attended with a rapid production of new cells, very rich in fat, in the follicles; and the most generally adopted view is that these cells drop off and fall to pieces by what is called fatty degeneration, and that their investing membranes or cell-walls become dissolved, thus, especially, the fat of the milk is produced; and some think that all the constituents of the milk are really nothing but cell ruins, taken up by the water that must come directly from the blood, even if nothing else does, and conveyed away through the ducts and reservoirs to the teats.

But Dr. Stuttevant maintains that the fat globules of the milk are really the cells themselves that are so rapidly multiplied in the follicles—that each globule began as a bud on a parent cell in the follicle, grew and then dropped off, and was taken up and washed along by the water containing the casein and the milk sugar in solution, which has been transudes from the tissues. With him Mr. Arnold agrees. This theory requires that each milk globule shall consist of a membranous sac inclosing fat; but the existence of such a membrane or envelope around the fat globule is almost universally disbelieved by microscopists, for nearly all who have given the subject their careful attention failed to find satisfactory evidence thereof. It will be, therefore, a battle of a few against a multitude to establish the fact of such a structure of the milk-fat globule; but in a battle fought with such weapons the victory is not always with the party that is strongest in numbers.

Fleischmann, than whom there is no better authority on matters pertaining to milk, is not entirely satisfied with the theory that the milk is made up of cell ruins alone. He shows that if this were so, in the case of a good milch cow, the dry weight of cell substance broken down every day would be not less than 5.5 lbs., or more than twice the weight of the dry substance of the milk glands of a well-developed udder. While allowing that there is much strength in the position of those who argue for milk production by cell destruction, he claims that there must be some secretion, or straining through, as it were, of a part of the substance of the milk, directly from the blood which circulates freely and abundantly through the glands.

But even with this partial acceptance of both explanations, we are not yet altogether enlightened as to the manner in which the milk is produced. Unquestionably, however, an important and a peculiar work is done in these glands; there is produced that mixture of the three essential ingredient of food—the albuminoids, the fat and the carbohydrates, which makes milk the type of a perfect food; and there originate those substances peculiar to butter fat, the butyrine and its associates, which are not found anywhere else in the animal body. They distinguish this fat in a marked manner from any other fat, whether animal or vegetable, and enable the chemist to tell with unerring directness whether a sample called butter is butter or something else.

LIABILITIES FOR INJURY TO PATIENTS DURING OPERATION.—The decision of Judge McAdam, in a recent suit before the Marine Court of New York, brought by Thomas J. Kelly against the dentist Colton, to recover for injuries caused by allowing a piece of tooth, which was being extracted, to drop down the plaintiff's throat while he was under the influence of laughing-gas, is one full of importance, not only to dentists, but to general surgeons as well. It is alleged that the piece of tooth slipped from the forceps, and for four weeks thereafter the plaintiff was troubled with a cough until he finally expectorated the piece. The court held that while a patient was under the influence of an anæsthetic which deprived him of the use of his faculties the operator was bound to exercise the highest professional skill and diligence to avoid every possible danger, and in this case it was the opinion of the court that the circumstances shown were sufficient to carry the case to the jury on the question of negligence. The judgment appealed from was in favor of the plaintiff for $500 damages, and this judgment was affirmed by the present decision.

THE ETHER SPRAY AN IMMEDIATE CURE FOR NEURALGIA.—Dr. McColganan extols the value of the ether or rhigolene spray for the instantaneous relief principally of facial neuralgia. He first had occasion to observe its good effects upon his own person, he having suffered greatly from facial neuralgia. Since curing himself he has had occasion to test its efficacy in about 20 cases. The result was invariably a most gratifying success. In many instances a permanent cure was established. He attempts to explain its action by supposing a complete change to take place in the nutrition of the affected nerve in consequence of the intense cold acting as a revulsive.—*Southern Practitioner.*

SUBSTITUTE FOR COD-LIVER OIL.—Among the numerous substitutes for cod-liver oil which have from time to time been brought before the notice of the profession, dugong oil, which is an extract obtained from the dugong, an herbivorous cetacean inhabiting the warm seas of the coasts of Australia and the Eastern Archipelago, has met with a most favorable reception. Dugong oil is free from the unpleasant odor and taste which characterize cod-liver oil, and is much less liable to change in keeping. At ordinary temperatures it is opaque from the separation of its more crystalline constituents, but becomes clear and almost colorless when slightly warmed. The dose is the same as cod-liver oil.

FREEZING AT THE MORGUE.—Every corpse that is taken to the Paris morgue is now immediately subjected to a freezing process, and so kept until it may be recognized or buried. This result is obtained by Carre's refrigerator, which is capable of reducing the temperature of the conservatory, where each body is laid out, to 15° below zero centigrade. At the back of this room is a row of compartments, in which the corpses are boxed up and frozen hard before being exhibited to public view.

VACCINATING A TRAIN-LOAD OF PASSENGERS.—The New York express train on the Erie railroad, passing east at noon, was held at Elmira, Nov. 9th, till physicians could vaccinate all the passengers not already safe from contact with small-pox, as a passenger afflicted with symptoms of the disease was taken from the train at Hornelleville.

Passing Events.

The great scientific event of the week was, of course, the "transit of Venus." From all the accounts which have reached us by telegraph the weather was generally favorable for observers, and the contacts were well defined. The photographs were good also.

It is stated that new mines have been found near Kicking Horse pass, in the Selkirk range, Montana.

New placer mines have been found too in Washington Territory on the Smillekeen river, which are causing considerable excitement.

Another discovery has been made in the Organ mountains, New Mexico. The ore contains gold, and excitement runs high in the vicinity over the discovery.

In this State there are no new strikes of note to record, but the miners generally are doing very well. So far the winter has been very mild indeed, and has been favorable for work in the mines and for prospecting also.

Quite a number of the men who have been working out at Bristol are drifting down towards El Dorado canyon. We fear that that camp will soon accumulate a large surplus of idle men; however, many of them can cross the Rio Colorado and proceed to the mining camps in northwest Arizona, but a few miles distant, where there are fair chances for obtaining employment.—*Pioche Record.*

California Mining Advantages.

California has several advantages as a mining country that are not possessed by other sections of more pretensions. In the first place, the State is pretty well settled up, and there are plenty of small towns or villages scattered all over, and miners are never necessitated to be very far away from a base of supplies. People who go prospecting do not have to lay in a great lot or provisions, but can always procure them handily. Again, supplies are never at all expensive. Provisions can be purchased everywhere at what, compared with the prices of mining regions generally, are very cheap rates. And another thing, too, steady, sober men, with any knowledge of prospecting and mining, can generally find people who will "stake" them if they wish to prospect.

The climate is such that a man can sleep out of doors all summer, and can carry on his work in the mines in the winter also. In most parts of the State it is possible also to prospect, though, of course, in other portions the snow would prevent this.

Another thing of advantage is the fact that means of transportation are available over a wide range. Not only are the railroad facilities now abundant, but the whole country is crossed and re-crossed with good roads, so that when mines are opened no large amounts are necessary to be spent in opening roads to the mines. An important feature, also, is the nearness to a great city, where everything desirable may be purchased. In San Francisco are immense foundries which make a specialty of manufacturing all the machinery and other appliances that the miner may want in any part of their business. In case of breakage there is no great danger of delay, since everything can be readily replaced at short notice.

It is also worthy of note that the population of the State is more stable and steady than in newer regions. That is, there are hundreds of men working for themselves on small claims here and there, and who live in one place all the time. We have, to a certain extent, got over the nomadic habits of the early California miner. The miners have been to all the early "excitements," and they know when it is best to stay at home. They know it pays better to work their mines on a small scale for themselves than to work big mines for other people. They have made homes for themselves all over the State, and have no desire to remove to more distant localities, thinking that California is good enough to "tie to" for a steady thing. These miners make up a population that, having an abiding interest in the State, is of great advantage to us. They work hard at their mines all the year round, and are steady, good citizens.

The State, therefore, while it is attracting no special attention to itself by sudden rich strikes or by old-fashioned "excitements," is doing very well indeed. When it comes to counting up results at the end of the year, California will be found to have held its own, and to count up a good many more dollars than other regions of more pretension.

New Process of Amalgamation.

A new process of amalgamation lately patented is intended to extract or separate the precious metals—such as gold and silver—from ores containing tellurium and "base" metals, the invention consisting in certain combinations of devices which constitute a mixing apparatus, into which the materials hereinafter named are placed for the purpose of mixing them with and amalgamating the ores, and also in a process of amalgamating the ores after they have been mixed with chemicals and placed in the apparatus. There is an air-tight case having agitators on it, and steam pipes also, so that the contents may be heated by steam.

To carry out the process the ores are first heated to a cherry red heat in the usual manner and then ground in a mill to a fine powder, a quantity of which is placed in the apparatus, to which the ingredients are placed. Supposing the amount of ore thus placed to be a ton, then the inventor adds two pounds of powdered ferro-manganese, dry, which is to be thoroughly mixed with the ore, and enough water added to completely saturate the mass. Ten pounds of bi-chloride of mercury are then taken and dissolved in warm water and added to the saturated ore in the apparatus. About two pounds of carbonate of soda are then dissolved in water, and also added to the mass. After this has been done and the apparatus tightly closed, steam is admitted until the whole contents are heated to the desired temperature, when the revolving shaft and its agitators are put in motion, thoroughly mixing the pulp and chemicals in one mass, the chemicals being thus brought in contact with the particles of metal contained in the pulp. The iron contained in the powdered ferro-manganese is acted upon by the chlorine of the bi-chloride of mercury, causing the mercury to attack the precious metals contained in the powdered ores. By this means chloride of iron, metallic mercury and amalgam of the precious metals are formed, and the loss caused by the flouring of the mercury avoided.

When the mass in the apparatus has become thoroughly mixed, and the pulp and chemicals brought into contact with the particles of metals contained in the pulp and properly amalgamated, the charge is drawn off or removed from the apparatus and the amalgam washed, collected and retorted off in the usual manner.

By the ordinary methods of amalgamating gold and silver ores, whether in stamp-battery, arastras or pans, a large loss of quicksilver occure, by reason of the flouring or granulation of this metal. These fine globules of mercury become coated with impurities, and so lose their power of cohesion, and while in this condition it is almost impossible for them to be brought together again in a mass. The solution of carbonate of soda is intended to remedy this flouring of mercury by cleansing the powdered ores and particles from impurities, thereby enabling the quicksilver to unite with the metal to form amalgam.

Wet Process for Extraction of Gold and Silver.

Wm. L Thompson, of Boston, Mass., has invented a wet process for the extraction of gold and silver which has some curious features. The invention is intended for the extraction of precious metals from two subdivisions of the class of ores known as "smelting," in contra-distinction to those known as "free milling" ores, viz: First, the pyrites division bearing gold and some copper, and second, the silver and gold-bearing division, containing antimony, arsenic and the like. The invention consists in first removing the baser metals by the formation of soluble double sulphides of the baser metals and the alkaline metals, and secondly, removing the gold by the fusion of the residuum with an alkaline poly-sulphide, forming a soluble compound, from which the precious metals may be readily recovered.

The several steps of the process may be described in detail as follows: In treating the pyrites ores the ores are first pulverized and mixed with the sulphides or sulphate of soda, and the mixture is then subjected to a roasting heat. In practice, with every 100 parts of an ore containing, say, 40% of the base metals, the inventor would add about 80 parts of the sulphides of soda, or about 130 parts of the sulphate of soda; but these proportions vary widely with the quality of ore. A soluble compound is thus formed when the sulphide used may be called a double sulphide of sodium and iron, and may be chemically expressed as $Na_2 Fe_2 S^4$. The formation of this compound may be facilitated if the sulphate is used by the use of a reducing flame, or by adding coal in small quantities to said mixture.

The soluble compound is next removed by leaching with water. The residue containing the gold is then fused with a poly-sulphide of an alkaline metal, such as sodium or potassium, thus forming in the latter case the auro-sulphide of potassium, a soluble compound containing substantially all the gold in the ore, and finally the mass is treated with water to separate the auro-sulphide of potassium from the residue in the form of a solution. As for the proportion of the polysulphide, enough is added to make a hall of the stuff when molten, that is, the liquid polysulphide makes a mud with the ore. More is used for a light ore than for a dense ore, and one-half the weight of the ore would be a fair proportion in ordinary cases. The process of chemical concentration or chemical separation of the base metals from the precious is thus completed, and the gold in the solution may be recovered by any of the well-known methods, such as by boiling or treatment by acids.

In treating the other divisions of ores, viz: those containing antimony or arsenic, the ore is pulverized and fused with an alkaline monosulphide, and then treated with water, thereby obtaining the sulphantimonite or the sulpharsenite of the alkaline metal in solution and leaving the ore concentrated. In these cases, to every 100 parts of an ore containing, say 50% of base metals, the inventor adds, say from 60 to 80 parts of the alkaline monosulphide; but, as before stated, circumstances would cause these proportions to be widely departed from in many instances, and they are only stated by way of illustration. From the residue the precious metals may be extracted by any suitable method, as by fusion with a polysulphide of an alkaline metal, which extracts the gold, and the silver may be extracted as sulphate by well-known processes which oxidize the sulphide already formed.

There is an English patent by Henderson something like this, but not exactly. Henderson first forms a regulus or matte of from 30% to 40% of copper, which is the usual initial step. He then fuses the matte and adds sulphate of sodium to take up the sulphide of gold; then casts in molds and leaches out the auro-sulphide of sodium. In Mr. Thompson's process he forms no matte, but works the raw ore with mono-sulphide of sodium, or its equivalent, to extract the iron, antimony and arsenic, and treats the iron deprived of these elements with a poly-sulphide of sodium of potassium, to cause the free gold to form an auro-sulphide. Henderson nowhere alludes to the use of polysulphides, and this is an essential feature of this process.

Cheap Smelting.—At Leadville, Colorado, such proficiency in smelting has been attained that ores are now reduced for $8 per ton. Some smelting firms are said to be taking contracts at figures still lower.

Mining in Mexico.

We see from the letters of correspondents in some of the papers that the people who have gone down to Mexico are not so well satisfied as they expected to be at the mines which they have found. Like a good many other places, the good mines are a little further on. When the purchasers arrive at the properties of which they have been told fabulous tales, they are apt to be a little disappointed at what they see Then, when an intelligent man expresses his disappointment at the prospect, he is told that the best mines are in some other part of Mexico. This seems to be always the case; the best mines are somewhere else.

The truth of the matter is that this is only a repetition of what all experienced men might expect. Exaggerated statements of the value of mines which are a great distance off are more apt to find credence than even moderate statements about mines that are near at hand. People are apt to believe more in what will be difficult to prove than they are in the things which are easily susceptible of proof. A moment's thought will convince anyone that this statement is true, and it is a phase of human nature that will account for numbers of blunders that are unaccountable on any other basis.

Some man who has traveled about Mexico, and looked casually at mines or examined small lots of ore, or half understood the stories which have been told him, comes back and tells yarns about the fabulous wealth that he has seen or heard of, and credulous people believe what is said without taking proper precautions to verify the statements made. The narrator himself may be talking in perfect good faith, but may have been deceived, or his judgment may not be good. We have all had experience with people who were easily impressible, and we all know that there is no subject on which a man can get excited as he can on mining; and this is always in proportion to his ignorance.

There is a sort of romance about the mines of Mexico. We have for years heard wonderful stories about them, and their enormous yield of silver. But every Mexican mine is not a bonanza any more than every Comstock mine was a California or Con. Virginia. Moreover, even these great mines gave out finally. It may be that in many cases people have invested on the past reputation of a mine without properly investigating its future prospects. There are, of course, a great many good mines in Mexico. And so there are in this country too. We have here the privileges afforded by a stable Government and a population that is accustomed to labor without taking every day for a holiday. There are no onerous taxes or duties put on the mining industry as in Mexico. Only a few of the mining companies which have gone to Mexico have prospered, and this lack of prosperity has been due greatly to circumstances which the companies could not control. They calculated on surroundings like they had at home, but found all sorts of annoying and expensive difficulties thrown in their road. If people will go to Mexico to mine, the best thing to do after being sure of the mine is to select some one for manager who has had *experience in Mexico*, and not send a man out who, because he has run a mine at home, thinks he can run a mine and the Mexican Government too. Some people who have gone there with that idea have cost their companies a good deal of money.

Mining everywhere has its vicissitudes, but in Mexico there are more things to contend with than are usually expected. People who go there expecting to come away in a few months with pockets full of coin are apt to find that they must work just as hard for money there as they have had to do elsewhere.

Damages for Accident in Mine.—In the San Francisco Superior Court Richard Carter, of Grass valley, has brought suit to recover $20,000 damages from the Idaho mining company of that place. The complaint is based on personal injuries received by the plaintiff while working in the defendant's mine, on the 26th of August last. Plaintiff had two ribs broken and was otherwise injured. Mrs. Jane Williams has also filed a complaint against the Idaho company to recover $50,000 damages for the death of her husband, Thomas Williams. Mrs. Williams is the daughter of Richard Carter, the above-named, and her husband was killed at the same time that Carter was injured. These suits make three that have been brought against the Idaho for damages growing out of the accident of the 26th of last August. R. B. Johns is one of the plaintiffs in addition to Mr. Carter and Mrs. Williams. The suits aggregate $90,000 in damages claimed.

Placer Mining at Victoria.—A dispatch from Victoria, B. C., says: The steamer *Idaho*, from Wrangel and way ports, reports that the placer mines have all stopped work on account of their sluice boxes freezing. The mines of Juneau City have had a profitable season and will make preparations to go on a larger scale next year. New claims have been discovered on Douglas Island, and are reported as being rich. The quartz miners still continue to prospect by trenching. It is reported that several new mills will be erected next summer. The Tradmer and Morris ledges look very rich, and the miners seem certain that they will turn out to be the richest mines yet discovered on the coast.

Abating the Smoke Nuisance.

The great increase of manufacturing industries in all our cities, with a corresponding increase in the consumption of bituminous coal, has caused the production of smoke from the boiler furnaces, as originally constructed, to become not only a great inconvenience and personal discomfort, but it has also become a serious detriment to public health. For this reason several of the principal cities throughout the Eastern and Western States have recently passed stringent laws for the abatement of the "smoke nuisance."

Chicago, perhaps, has been more in earnest in this matter than any other city, and the success which has attended the efforts in this direction there furnishes sufficient evidence that the production of great clouds of smoke from chimneys in the heart of the city is not only unnecessary, but wasteful, and should not be allowed.

We venture to assert that in the cities of London, Manchester, Sheffield and other manufacturing centers of Great Britain, and in our own cities of Pittsburg, Cincinnati, New York, Chicago, St. Louis and numerous other places, the destruction to property in the defacing of finely-painted buildings, the ruining of furniture, fine lace curtains, works of art, etc., by smoke, soot and cinders continually emitted from the smoke stacks connected with manufacturing establishments, to say nothing of the detriment to public health, is nearly equal to the cost of the fuel consumed; especially is this so if we take into account the further damage caused by the thousands of lesser chimneys attached to houses, which are sending out smoke and soot, if not in great quantities individually, taken collectively are none the less destructive to property, and a nuisance to the public at large.

In England, ever since the first patent for the consumption of smoke was issued to James Watt, in 1785, public attention has been called to this nuisance, and many are the devices which have been invented to accomplish that end. Still, notwithstanding these "smoke-abating exhibitions" have been made, and a great rivalry has been engendered between the different devices for accomplishing the desired end, the exhibitions being held to show the relative practical advantages which attach to each.

In Francisco,

After much newspaper discussion and numerous reiterated complaints have been made, the Board of Supervisors have at last felt called upon to take the matter severely in hand. At their meeting on Monday evening last, an ordinance on this subject came up for final passage, when a very interesting discussion arose, in which Supervisor Molinenx remarked that he thought it was generally conceded that if smoke could be consumed by those creating it, it ought to be. Its consumption would be in the interest of every housekeeper, in that of fresh air, cleanliness, health and comfort. He had made no special effort to look the matter up, but, since the introduction of the ordinance, he had been waited upon by several gentlemen, who had expressed their satisfaction at its introduction. He had also been informed that in London and Glasgow smoke-consuming was the rule, and that it was largely done in the Eastern cities. At the outset he had called upon Mr. Angell, Superintendent of the Golden Gate and Miners' Iron Works, who was a competent engineer, and had studied the subject of smoke consumption. He (Mr. Angell) had shown the speaker his furnace and how easily and thoroughly in the power of anyone it was to consume the smoke. No patent was required; all that was necessary was to leave room in the furnace for the consumption of the smoke, and room for air over the surface of the fire. He (Mr. Molineux) had asked the probable expense of fixing a furnace so that its smoke should be consumed, and he had been informed that $50 would be sufficient for any furnace in the city. There were, he understood, already 200 furnaces in this city consuming their own smoke.

Mr. Milliken, of California street, a competent and well-known engineer, had informed him (Mr. Molineux) that the plan could be adapted to any furnace in the city, and that he would like to adapt it, on condition that he should receive the amount of the saving of coal the alteration would result in during six months.

Smoke Consumption at the East.

A copy of the *Iron Age*, of October 26th, which Mr. Molineux had seen, had shown him that the subject was agitating all the large Eastern cities. In Cincinnati there was, until last year, an inspector of smoke. It was his duty to endeavor to get the owners of furnaces, etc., to consume their smoke. On the 1st of last January there were only seven furnaces in Cincinnati consuming their own smoke, and the smoke from the rest was intolerable. On October 1st there were 300 consuming their smoke, and the improvement in the atmosphere was said to be very marked. The reform had received the most cordial appreciation of the citizens. The only persons who objected were the stokers and firemen, but loss of their position by some of them and the arrest of some others settled their opposition. The consequence was that Cincinnati, once notorious for its smokiness, would soon have a perfectly clear atmosphere. Mr. Angell had told him that the consumption of smoke effected a saving in fuel of some 35% to 40% to each furnace. Mr. Molinenx hoped the ordinance would pass. He knew the books were already crowded with ordinances that were not enforced; but in this case citizens themselves could see to the enforcement.

In this connection a few words in regard to the principles involved, and the practical methods for their abatement may not be out of place in this journal.

Smoke Burning.

In the general terms as understood by steamers, is a fallacy. The proper way of getting rid of the nuisance is *not to make it*. This is not only the *proper* way to attain the end in view, but it is also the surest and most economical way. The usual methods employed, both in this country and in England, has been to admit fresh air at or above the bridge wall of boiler furnaces. This is neither a sure nor perfect way, nor is it economical. Even the improvements on that method of introducing hot air is but little better, and is much more expensive, although the principal be been largely introduced,

As already intimated, the true way for the construction of furnaces is that by which a sufficient quantity of oxygen can be introduced exactly where it is wanted—which is upon every side of the furnace, and before the liberated gases are cool enough to form smoke. By this process a little smoke may sometimes be formed just as the first coals strike the burning mass in the furnace, but with careful management none at all need pass the bridge. The intense heat produced by providing a constant and full supply of oxygen to all sides of the furnace, burns the gases the instant they are liberated, and thus utilizes the last unit of heat, so that there can be neither nuisance nor waste. It has long been a matter of surprise to the writer that some one has not heretofore been able to so introduce air to furnaces as to fully meet the above requirement, and thus obtain perfect combustion.

A New San Francisco Device.

We accidently last week met a gentleman in this city who has made a study of the economical use of fuel and prevention of smoke, and from a careful examination of his drawings and models, and after having had his theory and application fully explained, it looks as if he had arrived at a true and natural solution of the problem in which perfect combustion can be attained, fuel economized and the prevention of smoke made certain.

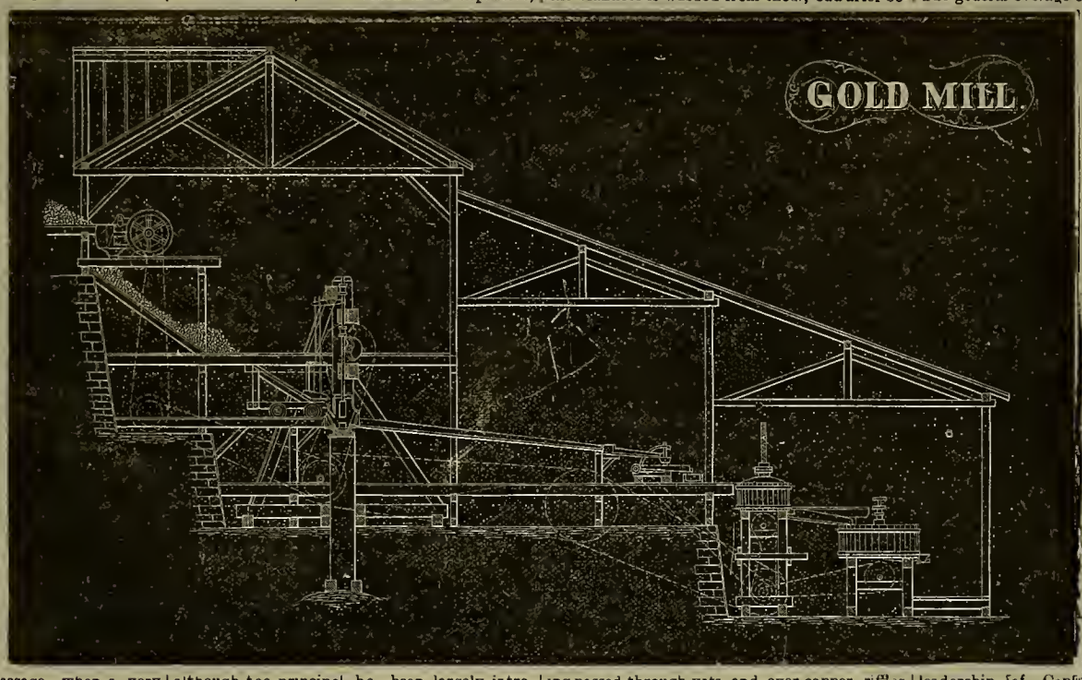
This gentleman has in successful operation an ordinary cook stove in the residence of one of our leading physicians which has been in use for a number of months, ample time to give a fair test as to its merits, which prevents smoke, and the same stove formerly was obliged to be thoroughly cleaned out as often as every two or three weeks, as the flues and pipe would become so filled up with soot and the draft became so impaired that it would not do the ordinary cooking for the family. Since this improvement has been put in neither the flues or pipe have needed cleaning, and it is doing its work now as well as the first day it was put up.

The arrangement for boiler furnaces, although working on the same principle or theory as the common stove, has to be somewhat changed in its manner of application; it can be readily introduced into any stationary, marine or locomotive boiler at a moderate expense, and the inventor claims that it will generate a greater amount of steam with a far less amount of fuel than can be done in an ordinary furnace and at the same time rid us of the dirty, black soot and smoke.

We shall hereafter enter more fully into the details of the principle and explain how it does its work from a more thorough knowledge of the subject. At present, after having had the inventor's ideas explained, it seems as if we had the prospect of the abatement of the smoke nuisance.

Gold Mills.

The processes for the extraction of gold from the auriferous quartz differ somewhat with the location of the mine and the character of the rock. In some mills the amalgamation is begun in the battery, the amalgam being collected upon silver-plated copper plates set in the morter and upon the apron; much is also gathered from the bottom of the morter. The sands and amalgam which pass the apron are subjected to a first concentration in blanket sluices, while that which escapes the blankets is passed through the first concentrators, and then through the second concentrators into the tailing sluices outside of the mill. That which is caught in the blankets is washed from them, and after being passed through vats and over copper riffles goes through the second concentrators into the tailing sluice.



In other mills the sands and amalgam which pass over the apron of the battery flow along sluices lined with copper, and then over blankets and through two sets of concentrators, the blanket washings being also concentrated.

There is some doubt as to the economy of the use of blankets for concentrating. In experiments to test the relative efficiency of blankets and concentrators, it was found that the same weight of concentrated matter from the concentrators yielded much more gold than the blanket sands. This would seem to indicate that with battery amalgamation discharging immediately into concentrators as good results may be attained as by the use of blanket sluices, and at a much less expense, the labor of blanket washing being altogether avoided.

The tailings from the concentrators are passed through a Wheeler amalgameting pan and a settler, and then run off from the mill. The amalgam is gathered and strained, and then retorted, to separate the quicksilver from the gold, which is afterwards melted in the melting furnaces and run into bars. The sulphurets, which are concentrated and delivered by the concentrators, are roasted in reverberatory furnaces and then reduced in chlorination works.

In last week's PRESS we gave an illustration of a silver mill, and on this page we give the arrangement of a gold mill, as designed by Prescott, Scott & Co., of the Union Iron Works, in this city.

Posting Mineral Notices.—The Secretary of the Interior confirms the opinion of the Commissioner of the General Land Office that posting a notice on the inside of a shaft-house is posting "in a conspicuous place" according to law. This was an open shaft-house, and no obstruction or difficulty in obtaining a view of the notice has been shown. In that locality it is common for notices to be so posted, and miners are accustomed to look in such places for the desired information.

The Denver Exposition—No. 16.

[Editorial Correspondence.]

Idaho Territory comes next in course in our review of the States and Territories whose mineral exhibits were prominent at the Denver exhibition. In no State or Territory in the Union are the precious metals more universally diffused in workable quantity than in Idaho. The State is triangular in shape, of vast extent, and covering an area equal to that of New York, New Jersey, Massachusetts and Connecticut combined. The Rocky Mountain divide forms its northeastern boundary for a distance of about 350 miles, along whose western slopes the waters of the Columbia river take their rise. Near the central portion of the Territory what is generally known as the Sawtooth range of mountains, extending about 200 miles north and south, with numerous spurs and buttes, rises to the hight of from 6,000 to 10,000 ft. Throughout all these mountains, and many others of lesser note, placers and quartz veins abound, some of which have been of fabulous richness. The general formation of the mineral regions is granite, with numerous protruding dykes of porphyry, between the walls of which two formations many well-defined true-fissure veins are found. The interior of the Territory is a vast elevated plateau, varying in altitude from 600 ft. in its lowest valley to 10,000 ft. above the sea on the top of its highest peaks. The general average of its elevation is from 2,000 to 3,000 ft. less than that of Wyoming or Colorado. Of its 55,000,000 acres of area, over 18,000,000 are classed as mountainous and mineral.

The name Idaho is a corruption of the Indian word *E-duh-hoe*, which signifies "Gem of the Mountains." The most notable incidents in the history of Idaho, like those in that of nearly every other State and Territory in the Rocky mountains and on the Pacific slope, are those connected with the discovery of the precious metals. The first gold discoveries here were made in 1852, on the Pend d'Oreille river, in the extreme north. Other discoveries were made farther south in 1854; but the most important of the early discovaries were made at numerous places along the Salmon and Clearwater rivers in 1858 and 1859. Both of these latter discoveries were made by military officers while engaged in the construction of military roads, and on the strength and faith of the latter the fourth regularly organized party of prospectors, under the leadership of Captain E. D. Pierce, commenced work on Orofino creek, a small Rocky mountain feeder of the Clearwater, in 1860. During that and the two or three succeeding years a large number of parties commenced working the placers in various parts of the Territory along the western slope of the Rockies. The riches of the Owyhee district, in the extreme southwestern portion of the Territory, were unearthed in 1863. The placer discoveries here were soon followed up by the opening of very rich and extensive quartz mines near Silver City, near which was discovered the famous Poorman ledge in 1865. A number of flourishing towns soon sprung up around this locality. In 1864 rich and extensive gold quartz discoveries were first made in what has since become the famous Wood River district. The very rich and heavy lead ores, which during the past two years have made this region famous throughout the mining world, were first discovered in 1873, but their practical development was delayed until 1880, mainly on account of the menaces of the Indians, but in great part also because of the difficulties in transportation of supplies, etc.

Rich Fields.

Explorations have proven that Idaho's mountains are fairly ribbed with veins rich in the royal metals. It was here that the famous Elmore was found, which, with a 20-stamp mill, once turned out $500,000 in 30 days, said to be the largest yield of gold for the term from any mill of that limited capacity in the world. The Morning Star, which once shipped 100 tons of ore that yielded $100,000, is fresh in the minds of many of our readers, as well as the subsequent output of the same mine in shipping the same quantity with a yield of $90,000. That mine has added $4,000,000 to the gold of the world. Then we have the Atlanta ledge, which once shipped 1,000 tons of ore 1,500 miles, to Omaha, from which $750,000 were milled. Idaho also boasts of the famous Custer ledge, from whose outcrop four men once took out ore enough in eight months to net them $650,000. A small area in Boise county is said

CHICAGO **FRASER & CHALMERS.** ILLINOIS

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing, The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES

Large or Small for flat or round rops. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin for Giant and Old Abe Co., Black Hills also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Holsts for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars.

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

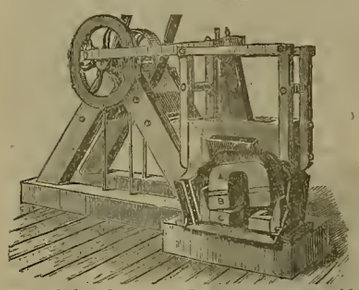
Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Riveta Hand Driven.

McCaskell's Patent Car Wheels and Axles—Best in Use.

New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.

MILL AND MINING MACHINERY.



Oscillating Stamp Mill.

It has no Stems, Cams, or Tappets, and adjusts itself to the wear of the Shoes and Dies.

For simplicity, economy, durability and effective working, it exceeds anything ever presented to the public, and will do the work of five stamps with one-fourth the power. Awarded First Premium and Medal at Mechanics' Fair, S. F., 1880.

Manufactured by

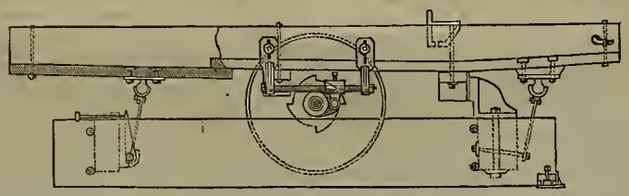
F. A. HUNTINGTON, 45 Fremont St., S. F., Cal. | FRASER & CHALMERS, 145 Fulton St., Chicago, Ill.

Improved Patent Grinding and Amalgamating Pans, Concentrators and Gold Amalgamators; also, Steam Engines and Mining Machinery of all kinds. Send for circulars.

F. A. HUNTINGTON,
45 Fremont Street, San Francisco, Cal.

F. A. HUNTINGTON,

No. 45 Fremont Street. - - San Francisco, Cal.

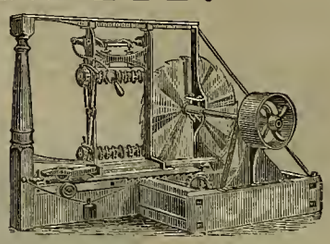


PATTEN'S CONCENTRATOR.

This machine requires less power, less care or attention, and is less liable to get out of repair than any concentrator now in use. All of which any practical miner will comprehend when seeing it in operation.

The wear and tear is nominal, and the construction so simple that any miner can put it up and run it; and the low price brings it within the reach of all mill men, as it will save enough to pay for itself in any mill in very short time. One machine will concentrate the tailings from a five-stamp battery.

☞ Send for Circulars. ☜



SHINGLE MACHINE.

For simplicity, durability and rapidity of action, these Machines have no equal, cutting from 3,000 to 4,000 per hour. They are now used by all the principal Millmen on the Pacific Coast.

SAWMILL MACHINERY,

Of all descriptions made to order.

F. A. HUNTINGTON,
No. 45 Fremont Street, San Francisco.

THE MOREY & SPERRY MINING MACHINERY CO.,

Successors to MOREY & SPERRY,

Manufacturers of all kinds of

MINING MACHINERY.

Gold and Silver Grinding, Concentrating and Amalgamating Machinery, Engines and Boilers of any size. Hydraulic Giants, Hydraulic Outfits. All the various kinds of Amalgamating Pans, Combination, Eclipse, Excelsior, etc. Settlers, Rock Breakers. Stamp Mills for Wet or Dry Crushing. Howland's Pulverizer, Improved Riffles, Retorts for Gold and Silver, Silver Plated Copper for free Gold Amalgamation. Hoisting and Pumping Machinery, Chloridizing Furnaces, etc. Mining and Mill Supplies of every description. Steel Shoes and Dies that last three times as long as any iron.

WAREROOMS: 92 & 94 Liberty St., New York,

Foundry and Machine Shop: Newburg, N. Y.

NOTICE.—The public and former friends and patrons of the old firm of **Morey & Sperry** are hereby notified that the above-named Company is the legitimate and ONLY successor to the said firm, having acquired all the drawings, patterns and machinery of the old firm, together with the lease and good will of its business.

We shall continue the business, with largely increased facilities, at the old place, having made connection with the Newburg Steam Engine works, which have been enlarged to meet the demands of this Company. Mr. Franklin Morey, of the late firm of **Morey & Sperry**, will manage the business of this Company. Information and estimates of the various styles of Mining and Milling Machinery cheerfully given. All orders filled promptly. Materials and Workmanship First-Class.

MOREY & SPERRY MINING MACHINE CO.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street - - San Francisco, Cal.

THE CONSUMERS' COMPANY.

VULCAN B B,

The Best Low Grade Explosive in the market. Superior to Black or Judson Powder

VULCAN NOS. 1, 2 AND 3,

The best Nitro-Glycerine Powders manufactured. Having secured large lots of the best imported Glycerine at low prices, we are prepared to offer the mining public the very strongest, most uniform and best Nitro-Glycerine Powder at the very Lowest Rates.

SPECIAL INDUCEMENTS IN PRICES.

Vulcan B B Powder (in Kegs or Cases) is Unequaled

For Bank Blasting and Railroad Work.

Caps and Fuse of all Grades at Bottom Rates.

The Central and Southern Pacific Railroads Use Vulcan Powder and no Other.

PATENT DETACHABLE TOOTH SAWS
Manufactory, 17 & 19 Fremont St., S. F.

Books for Miners and Millmen.

KUSTEL'S CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for gold-bearing sulphurets, arseniurets, and gold and silver ores generally, with 120 lithographic diagrams. 1867. This work is unequaled by any other published embracing the subjects treated. Post-paid, $7.50. Printed and sold by Dewey & Co., S. F.

KUSTEL'S ROASTING OF GOLD AND SILVER ORES (Second Edition, 1880), and the Extraction of their Respective Metals without Quicksilver. Illustrated. 156 pages. A valuable and carefully written work. Postpaid, $3. Sold by Dewey & Co., S. F

AARON'S LEACHING GOLD AND SILVER ORES.—The most complete hand-book on the subject extant, 164 pages octavo. Illustrated by 12 lithographic engravings and four woodcuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by Dewey & Co., S. F.

PHILLIP'S EXPLORERS' AND ASSAYERS' COMPANION (Third Edition) Price of Vol. 1, post-paid, $6. Sold by Dewey & Co., S. F

COPP'S AMERICAN MINING CODE, to replace Copp's Handbook of Mining Laws, now out of print. United States, State and Territorial Mining Laws and Land Office Regulations; Digest of Land Office and Court Decisions; List of Patents Issued, and Dr. Raymond's Glossary, with Forms for Mechanics' Liens, Location Notices, etc. Price, postpaid, in paper, 50 cts. Sold by Dewey & Co., S. F.

THE EXPLORERS' MINERS' AND METALLURGISTS' COMPANION, by J. S. Phillips, M. E., comprising a practical exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy, containing 672 Pages and 33 Engravings. Price, bound in cloth, $10.50. Sold by Dewey & Co., S. F.

CHURCH'S "COMSTOCK LODE, ITS FORMATION AND HISTORY."—Illustrated with diagrams and colored charts showing sections, ore bodies, etc. Post-paid, $7.50. Sold by Dewey & Co., S. F.

U. S. MINING LAWS AND COAL LAND LAWS—Containing instructions and blank forms. Postpaid, 50 cents. Sold by Dewey & Co., S. F.

MINING, ENGINEERING, MECHANICAL, FARMING, SCIENTIFIC, INDUSTRIAL AND NEW BOOKS in general can be ordered through Dewey & Co., publishers of the MINING AND SCIENTIFIC PRESS, S. F., at publishers' rates.

San Francisco Pioneer Screen Works
J. W. QUICK, MANUFACTURER,
SCREENS
Several first premiums received for Quartz Mill Screens, and Perforated Sheet Metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using Battery Screens extensively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.

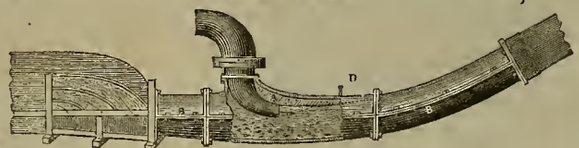
GOLD MINERS

WORKING PLACER, GRAVEL AND QUARTZ MINES,
SAVE YOUR GOLD!
— BY USING —
SILVER PLATED AMALGAMATING PLATES.

The most economical and successful process now in use. Will warrant my Plates to save more gold than any other method, and double the amount of the same surface of ordinary copper plates. The only plates that have proved durable and satisfactory.

OLD MINING PLATES BOUGHT, TAKEN IN EXCHANGE FOR NEW, OR RE-PLATED.
ALL KINDS OF METAL GOODS PLATED!
San Francisco Gold, Silver and Nickel Plating Works,
653 and 655 Mission St., bet. New Montgomery and Third, San Francisco.
Send for Circular EDWARD G. DENNISTON, PROPRIETOR.
Awarded the First Premium at every Fair of the Mechanics' Institute for the last 12 Years.

HYDRAULIC GRAVEL ELEVATORS,



For working flat gravel mines that have no dump.

Sluices gravel and water up hill on an angle of 45°, and will run any kind of gravel that will run in a flume. Handles rocks as easy as fine dirt, and will raise as much material as the water will carry off in a flume on 6 inches grade to 12 feet.

No bedrock cuts, tunnels or drains required. Machine a sufficient drain itself, and the process of mining the same as any other hydraulic mine. Is now a practical success in various places in California and Oregon. Send for descriptive circular to

JOSHUA HENDY.

The Denver Exposition.

(Continued from Page 377.)

to have produced $20,000,000 since its first discovery in 1864. In all, Idaho, with but a sparse population, and with very imperfect railroad or other transportation facilities, has already added $90,000,000 to the commerce of the world. Nearly all this large gold aggregate has been obtained at points nearly 300 miles from the track of a railroad. Of course the yields mentioned are special and extraordinary, but there are rich mines in all parts of the Territory, and many additional ones will be worked when better facilities for transportation are opened up. Idaho's record of the past is good, but her promise for the future is better. Sufficient developing has been done to demonstrate that it is rich in minerals. Its climate is mild, a fact which is conducive not only to continued and economical mining operations, but, with its numerous fertile valleys, opportunities are thereby presented for diversified industries. It contains every element needed for building up a large population, and awaits only the coming of the iron horse to be able to utilize its wonderful natural resources to their fullest extent.

The Great Yield of the Placers

Of Idaho from 1864 to 1868 attracted quite a large population. The placers, of exceptional richness, being worked out in a few years, and the surface rock of a few quartz mines, also very rich, being likewise in a measure exhausted, produced something of a reaction, which put the Territory somewhat under a cloud until the improved yield from 1873 to 1877 again revived the interest of the early miners in that region. Since that time mining has settled down to a more permanent basis, with full confidence that steady and persevering work and development will not fail of its reward. The yield of precious metals for 1881 was in the vicinity of $4,000,000.

From the very beginning of placer mining in Idaho the Territory has labored under many disadvantages. For many years the Indians were very troublesome. The miners were much involved in lawsuits. Railroads had no existence there, and even wagon roads were almost unknown, and the different mining camps were generally reached by pack trains over steep and rugged mountain ranges. There is now evidence that better times are in store for the mining interests of Idaho. The Indians have gone upon reservations or are quiet. Titles to mining property are better settled. Railroads are shortening the distances from and to the principal commercial points, and good wagon roads and bridges are being constructed in all parts of the Territory. With this altered condition of matters capital is now more freely finding its way to the mines, and reports of important mining sales and the projection of mills and smelters are of quite common occurrence.

Wood River.

Within the last two years much attention has been attracted to a locality known as Wood River, the mines of which yield an exceedingly high grade class of smelting ores. The formation is principally granite, traversed by belts of lime, porphyry and shale, carrying usually, in contact veins lodes of argentiferous galena and carbonates, while in the granite itself are found numerous veins of free gold and sulphurets. The special interest in this region commenced in the fall of 1880, which was largely increased in the spring of 1881. During the latter season many very valuable locations were made. The total production of the Wood River mines for 1881 is estimated at a million of dollars, which yield will probably be considerably more than doubled during the present year. The reported yield of Idaho does not include the products of ores shipped out of the Territory for treatment. The product of such shipments for the past two or three years has been very large. Thousands of tons of ore have thus been shipped to Utah, and much also to Omaha and other places.

The somewhat noted Sawtooth district lies immediately contiguous to the Wood River mines, upon the north. The mines of this district are much like those of Wood River. Many of them are very valuable and productive. The town of Hailey, the chief commercial center of this region, will soon be, if it is not already, in railroad connection with the Central Pacific, which will greatly facilitate mining operations throughout all the Wood River country. Many of the mountains flanking on Wood river have as yet been barely touched by the prospector's pick, hence there is good reason to expect that many other important discoveries will be made in the early future.

The Idaho Exhibit,

The Territory of Idaho, for reasons already given, labored under great difficulties in placing a fair and proper representation of her mineral resources in the Exposition at Denver. Both the Governor and Secretary of the Territory labored hard and earnestly to secure that object. There were seven or eight counties represented, but the chief display was from the Wood River district, which is the nearest to railroad communication. Nearly 50 mines were represented from this district. The Idaho pavilion was well and tastefully arranged, under the supervision of Messrs. J. L. Onderdonk and H. Z. Burkhardt. Mr. Onderdonk being called away during the early part of the continuance of the Exposition, his departure was made noticeable by the interesting incident of the presentation to him of a gold medal by his fellow Commissioners through the hands of Mr. Zehandelaar, of Utah. Mr. Burkhardt performed the duties of Commissioner during the balance of the time.

Rich Mines.

Some of the finest specimens on exhibition were from the Atlanta mine, in Altmas county. They consisted mainly of ruby and native silver. This mine has produced about one million dollars, while the deepest working is as yet only 200 ft.

The chief mine represented from Custer county was the celebrated Custer mine, owned by Messrs. Haggin, Tevis & Hearst, of this city. The daily yield of the 40 ton mill upon this property was reported at $4,000. Mining experts recently reported $2,500,000 in sight at the mine. The vein is a very heavy one, with outcrops from 60 to 100 ft. wide. The picked ore mills from $300 to $700 per ton, and sometimes more. In the last Mint report it is stated that very little rock from this mine yields less than $100 per ton, the average rock generally running from $120 to $180 per ton. The ledge was opened to a depth of 300 ft. a year or more ago, and it is believed that the ore actually in sight cannot be exhausted in three years. Samples from the Solace mine, in the Sawtooth region, also belonging to Haggin, Tevis & Co., were exhibited, one of which represented ore which pays 958 ounces of silver to the ton. This is a four foot vein of sulphurets and antimonial silver.

The Pilgrim, from the same district, also exhibited rich specimens. It was discovered in 1879, and sold in 1881 to Col. Green and some other capitalists of this city for $40,000. The property is now held at $500,000.

The Minnie Moore, owned by Moore, Miller & Lusk, of this city, is one of the largest deposits of ore yet opened in the Wood River mines. Eight openings have been made at different points across the mine upon its surface, each of which shows a large vein of galena from 13 in. to 5 ft. in thickness. A shaft 70 ft. deep also shows ore all the way down from three to six feet wide, with an average value of about $90 to the ton.

Large amounts of capital are now being attracted to the Wood River district from the various commercial centers of the East and from San Francisco.

Mills and Smelters.

We have before us an imperfect list of the mills and smelters in Idaho, in which the names and localities of 31 quartz mills and 13 smelters are given. The list was made out nearly two years ago, and was no doubt very imperfect at the time, while the number of both mills and smelters has been largely increased since, particularly the latter. W. B. Ewer.

Valvoline.

"Valvoline" is a name applied to a class of steam cylinder and machine oils which have been on the market for some 12 years past—East and elsewhere—but which have not been so well known here until lately. The oil is purely a mineral one, containing no acid, and comes from the famous Pinmer farm, on the Allegheny river, Pennsylvania. Mineral oils do not contain fatty acids, are incapable of being decomposed, and do not form insoluble soaps. This Valvoline is a hydro-carbon which stands a very high temperature without generating acids, or leaving a gummy deposit about the piston. These facts have been established by many of the best engineers who have been using this oil for years. It is not decomposed by high pressure steam, as animal and vegetable fat is apt to be, liberating fatty acids; and as it does not boil at high temperature, the consumption of lubricant and wear and tear of machinery are reduced. The Valvoline is filtered by the Cheeseborough process, so that it is clear and clean.

All iron is more or less porous, and oil with any sediment is apt to leave sediment on the cylinder. The instructions Mr. Bromley, the agent, gives to engineers who are beginning to use Valvoline are as follows: "If you have been using tallow, sperm or animal oils, the first duty it performs is to thoroughly dissolve and remove the accumulated gum and corrosion from the surface and pores of the metal. During the process of cleaning, if your engine works stiff, grunts or makes a rubbing noise, I would recommend that you mix Valvoline oil with the oil previously used, in the following proportions, the object of which is to gradually remove the residuum left by using other oils. The first week, mix one quarter Valvoline with three-quarters of the oil you have been using. For the following week or two mix half and half; after this, continue to use Valvoline oil clear, and soon you will find that your engine works easier, requiring less oil than formerly.

The "Valvoline" is not a distillate, but a prepared residuum from the distillation of petroleum by a peculiar process. The heat for the distillation is obtained from superheated steam, in order that a uniform temperature may be commanded, and to avoid the production of undesired hydro-carbons by the high, variable and localized heat necessarily employed with ordinary retorts. The steam is first generated in common steam boilers at the pressure of about 40 lbs. per square inch above the atmosphere, and has the temperature of about 287° Fahrenheit, after which it is super-heated to the temperature of about 1,100° Fahrenheit, by carrying it through iron pipes placed in furnaces used only for that purpose. The heat of this steam is imparted by a peculiar process to the crude petroleum, of which about 70 per centum undergo distillation, the residuum of about 30 per centum being then drawn off, and passed through bone charcoal filters, until all the bituminous and foreign matter, earthy or otherwise, are removed. So efficacious is this process that the residuum can, if required, be completely deodorized by it, and produced of a snowy whiteness. The "Valvoline" thus manufactured has, at the temperature of 50° Fahrenheit, density of 26½° Beaume, corresponding to the specific gravity 0.8888. The color is a dark greenish brown and the body or tenacity is considerable.

Several grades of this oil are made, from cylinder to watch oil, each grade made specially for certain kinds of work. As before stated, it is extensively used, East and abroad, but it is only lately any regular agency has been established here The manufacturers do not furnish this oil to dealers or authorize them to offer it for sale, thereby protecting their oil from adulteration. The only person authorized to sell this oil here is H. H. Bromley, 43 Sacramento street. In a few months he has succeeded in introducing it to many of our largest manufacturing establishments and companies. He has highly appreciative letters from the first-class people of this city. In fact he is willing and able to refer to any first-class machine builder in America. Wherever there is trouble from foaming of boilers, where surface condensers are used, this oil is invaluable. It is heavy, and will prevent the boilers from foaming, and will also prevent the formation of scale.

This oil is used by the French navy, the Turkish navy, the Argentine Republic and by thousands of individuals everywhere. All who use it give it an unqualified recommendation. It leaves no deposit and removes that which has formed. The Centennial commission reported as follows: "Valvoline cylinder oil is commended for its purity, high fire-test and excellent lubricating body." The Board of Engineers of the New York Navy Yard, which investigated the manufacture and superior advantages claimed for Valvoline as compared with sperm, olive and animal oils for marine engines and preserving boilers, condensers, rubber valves, etc., presented an elaborate report, giving their opinion that Valvoline was as good a mineral oil as could possibly be obtained for the purpose, removing one of the causes, and a very potent one, of the rapid corrosion of steam boilers when fed with distilled water from surface condensers; carrying with it the fixed oils from organic substances heretofore employed for the lubrication of the valves and pistons of steam engines.

Pacific Coast Weather for the Week.

[Furnished for publication in the Press by Nelson Gorom, Sergt. Signal Service Corps, U. S. A.]

The following is a summary of the rainfall for each day of the week ending 11:58 A.M. Wednesday, Dec. 6th, for the stations named:

Our Agents.

Our Friends can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men

G. W. McGraw—Santa Clara county.
M. P. Owen—Santa Cruz county.
J. W. A. Wright—Merced, Tulare and Kern counties.
Jared C. Hoag—California.
L. L. Woodmansee.
B. W. Crowell—Los Angeles county.
L. Walker—Butte, Colusa and Sierra counties.
S. E. Baker—Eastern States.
J. Wiltse, Amador county.
Geo. McDowell—Alameda county.
N. H. Hapgood—Plumas county.

Old Papers Wanted.

Twenty cents each will be paid for a limited number of copies of any of the following Nos. of the Mining and Scientific Press, if received soon at this office: No. 1, of Vol. 13, 1866; No. 5, Vol. 18, 1869; Nos. 1 and 26, of Vol. 20, 1870; No. 1, of Vol. 22, 1871. Also, 10 cents per copy for Nos. 2, 3, 4, 7, 10, 11, 12, 13 and 15, of Vol. 30, 1875. If any one who has files of back volumes of the Press, which they may like to dispose of at a moderate rate, will send us a memorandum of the same and the price, we may be able, sooner or later, to assist in their disposal.

Patents and Inventions.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in Dewey & Co.'s Scientific Press Patent Agency, 252 Market St., S. F.

For Week Ending November 21, 1882

267 738.—Cough Remedy—Hanneh Branch, North San Juan, Cal.
267,975.—Newspaper File Holder and Binder—A. T. Dewey, S. F.
267 741.—Ventilator—M. H. Dorgan, S. F.
267,686.—Preparing Baker's Yeast—Goll & Spinner, S. F.
267,877.—Hopple—C. J. Gustaveson, Salt Lake, U. T.
267,687.—Ore Crusher—W P. Hammond, Napa, Cal.
267,749.—Car Coupling—E. M. Hobbs, Santa Rosa, Cal.
267,907.—Amalgamator—W. H. Leininger, Salem, Or.
267,799.—Cork Swimming Suit—P. Plant, S. F.
267,958.—Crosscut Saw—Geo. W. Wills, East Portland, Oregon.
267,765.—Gate—Chas. A. Wyman, San Jose, Cal.

For Week Ending November 28, 1882.

268 351.—Ore Concentrator—L. M. Atchison, S. F.
268,352.—Hood for Stirrups—Alex. Ayers, San Jose, Cal.
268,076.—Clothes Drier—T. D. Brown, Oakland, Cal.
268,081.—Steam Trap—Geo. W. Coffee, S. F.
268,114.—Self Regulating Lamp—Vincent Di Marzo, Benicia, Cal.
268,087.—Two Wheeled Vehicle—Wm. C. Evants, Portland, Or.
268,092.—Brake Block—U. M. Gordon, San Rafael, Cal.
268,093.—Knit Shirt—Thos. M. Grant, S. F.
268,233.—Elevator—P. Hinkle, S. F.
268,115.—Ore Stamp Battery—J. M. McFarland, Virginia City, Nev.
268 371.—Lifting Jack—T. J. Pearce, Oakland, Cal.
268,125.—Window Screen—Geo. L. Reynolds, Oakland, Cal.
268,135.—Adding Machine—Shattuck & Thorne, Jr. Oakland, Cal.
268,137.—Saw Teeth—N. W. Spaulding, S. F.
268,306.—Fifth Wheel—Edward Squiree, Portland, Or.
268,145.—Sofa Bedstead—Robt. W. Taylor, S. F.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co. in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press American and Foreign Patent Agency, the following are worthy of special mention:

Brake-block.—Upton M. Gordon, of San Rafael, Cal. No. 268,092. Dated Nov. 28, 1882. This invention relates to certain new and useful improvements in brake-blocks, and it consists in the novel construction of the body of the block and of the rubber or shoe thereof, whereby the latter may be readily inserted or removed when worn for the substitution of another; and, further, in the means of fastening the block to the bar or shaft which supports it, whereby it may adjust itself squarely against the wheel, whether it be raised or lowered, by reason of the weight in the wagon. The objects of this invention is two-fold. In the first place it is customary to form the rubbing surface of the brake-block of some hard wood. This is found to be the most desirable of all substances, but it soon wears, and then leather is secured to the wood to keep the thickness of the block. This is done as a temporary expedient and and because of great difficulty in fitting a new piece of wood to the present style of socket. This construction remedies this difficulty by making it an easy matter to release the old wooden rubber and insert and secure a fresh one. In the second place it is found, especially in the case of spring wagons, that when the body is heavily loaded the brakes are depressed beyond the point where they usually impinge upon the wheel, and being generally rigid upon their bar, they cannot adapt themselves to this changed position, and do not therefore fit their faces squarely against the wheel. This overcomes this by the means shown by connecting the block with the bar.

Mill.—James M. McFarland, of Virginia City, Nevada. No. 268,115. Dated November 28, 1882. This invention relates to certain new and useful improvements in ore-stamp batteries. It consists in the provision of a peculiar speeding device having two arms, one of which is acted upon by the revolving cam and the others act upon the tappet. In the ordinary form of stamp-battery in which the stamp is raised and dropped by a revolving cam acting under and upon a tappet upon the stamp-stem, a difficulty found to exist is that when the cam is revolved above a certain rate of speed it makes its revolution and catches the tappet before the stamp has had time to strike the die. The object of this invention is to overcome this difficulty by providing a means for speeding the stamp, whereby it will be impossible for the cam to reach the tappet before the stamp has reached its limit of descent.

Saw Tooth.—N. W. Spaulding, Oakland. No. 268,137. Dated Nov. 28, 1882. This invention is more particularly applicable to that class of saw teeth known as "inserted teeth." It consists mainly in the employment of removable hit-holders which are fitted to the saw-plate; in the formation of an independent removable point or hit for each tooth or holder, and in a novel method of securing these points firmly, but at the same time so that they may be easily removed.

Mining and Other Companies.

Persone intereeted in incorporatione will do well to recommend the publication of the official noticee of their companies in thie paper, as the cheapeet appropriate medium for advertieing.

DIVIDEND NOTICE.

OFFICE OF THE

Navajo Mining Company.

San Francisco, December 4, 1882.

At a meeting of the Board of Directors of the above-named company, held this day, Dividend No. 4, of twenty-five (25) cents per share, was declared, payable on Wednesday, December 13, 1882. Trsnefer books closed on Thursday, December 7, 1882, at 3 o'clock P. M.

J. W. PEW, Secretary.

Attention, Boiler-makers and Engineers!

Just Out! The Best Work of its Class Published!!

The Theoretical and Practical Boiler-maker.

By SAMUEL NICHOLLS, Foreman Boiler-maker. Embraces full details of Geometry and Orthographic Projection as applied to Boilermaking; also to make, draw, design, and set out all kinds of Templet Work, as Ellipses, Cones, Truncated Cones, Oblique Cones, Frustums of Cones, Chimney Bottoms, Cylinders, Cylinder and Cone, Cylinder and Sphere, Cylinder connected with Curved Tube, Cylinder and Angular Tube, Cylinder with Spiral Staircase, Hip Roof and Cylinder, Tubes, Angular Tubes, T Tubes, Taper Tubes, Curved Tubes, Quadrant Tubes, Downtake Tubes, Flues, Spheres, Domes, etc., of every kind, illustrated with 74 diagrams, including a full solution of all the problems relating to Boilermaking. The Cylinder, its sections, penetration, and development. Welding and Construction, Drilling, Punching, Riveting, Single and Double Riveted Lap and Butt Joints, with Single and Double Strips. Diameter, Spacing, Strength, and Pitch of Rivets; Strength and Pitch of Stays. On Locomotive, Marine, Cylinder, Multitubular, and Egg-ended Boilers; Power of Boilers; Heating Surface of Boiler Tubes in square feet; the Lever Safety-Valve; the Cylinder; the Sphere; Area of Fire Grates; Quantity of Steam required for an Engine; Flat Surfaces, Boiler Explosions; Practical Notes on Steam; Properties of Saturated Steam; Proportion of Boilers; Bursting pressure of lap-jointed Wrought Iron Cylindrical Boilers. Collapsing pressure of Wrought Iron Cylindrical Tubes of varying thicknesses. Practical Rules, Instruction, and Memoranda for Boilermakers; Material for Boiler Construction; Weight, Strength, and Dimensions of Wrought Iron Boiler-plates and Iron Bars, Strength of Steel Plates, treatment of do.; Strength of Plates at different temperatures; Strength of Ropes and Chains; Properties of Metals; Weight of Wrought Iron Cylinders per lineal foot of any given diameter and thickness; Angle-Iron Hoops; Diam., Cir., and Areas of Circles, with detailed calculations relating to Boiler Construction; to determine thickness of Boiler-Heads, Cylinder Covers, etc. Mensuration as applied to Boiler-making, Fuel Values, Combustion of Fuel, Evaporation of Water; Setting Boilers, Incrustation, Boiler Scale Preventives, 35 kinds; Decimal equivalents; Weight of Water; Expansion of Water; Squares, Cubes, and Roots; Fusing Points of Metals; Conducting Powers of Metals; Useful Definitions, Reference Tables (83 pages) for Boiler-makers, Engineers, Smiths, etc. 1 vol. 12mo, extra cloth. Mailed post free to any address on receipt of $2.50. Send for 128 page Illustrated Catalogue of 3000 Standard Books on every subject. *Agents wanted.*

National Book Company, 73 Beekman Street, New York.

SULPHURETS.

Clean Concentrations wanted. A party from the East having a process for working low-grade Sulphurets, will commence purchasing the same as soon as assured of an abundant supply. Gold-bearing Sulphurete preferred, having an assay value of $20 per ton, or upwards. Address,

A. B. WATT, P. O. Box, 2293, San Francisco.

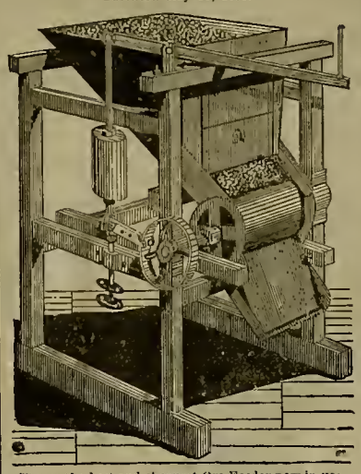
THE ROLLER ORE FEEDER.

Patented May 28, 1882.



This is the best and cheapest Ore Feeder now in use.

It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery, as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

WATER JACKET SMELTING FURNACES

—FOR—

Galena Silver & Copper Ores.

The PACIFIC WATER JACKET SMELTERS embrace many features that are entirely new and of great practical utility, which are covered by lettere patent.

No other furnaces can compare with these for durability and in capacity for uninterrupted work.

MORE THAN SIXTY of them are now running on the Pacific Coast, giving results never before obtained as regards continuous running, economy of fuel, grade and quality of bullion produced. We are prepared to demonstrate by facts the claims here made.

These Smeltere are shipped in a complete state, requiring no brick or stone work, except that for the crucible, thus saving great expense and loss of time in construction.

Complete smelting plants made to order of any capacity and with all the improvements that experience has suggested as valuable in this class of machinery. Skilled and experienced smelters furnished when desired to examine mines and to superintend construction and running of furnaces. Estimates given upon application.

Send for circular.

MINING MACHINERY A SPECIALTY.

Our manufactures of mining machinery embrace every kind of machine and appliance for the mining and reduction of ores.

We have had an experience of more than twenty years in the manufacture and practical operation of mining machinery in Colorado and the neighboring States and Territories.

Our facilities are superior to those of any manufactory in the West, our works having been recently rebuilt, greatly enlarged and completely equipped.

We invite the investigation of mine owners and mill men seeking machinery. We can furnish, on board, at our works, or set up at the mines anywhere in the Rocky Mountain region, on short notice, the following machinery: Cornish Pumps, Steam Pumps, Stamp Mills for Wet or Dry crushing, Pans, Settlers, Agitators, Retorts, Bullion and Ingot Moulds, Reverberatory Furnaces, Bruckner Cylinders, Revolving Roasting Furnaces and Dryers, Melting Furnaces, Concentrating Machinery, Rolls, Crushers, Conveyors and Elevators, Ore samplers and Grinders, Hoisting Engines, Water Jacket Furnaces, Slag Pots and Cars, Lead Pots and Ladles, Blast Pipes and Water Tuyeres, Blowers, Cupellation Furnaces, Market Kettles, Wire Rope, Cages, Buckets, Skips, Ore Cars, etc. Estimates furnished and prices quoted on application. Send for illustrated catalogue.

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

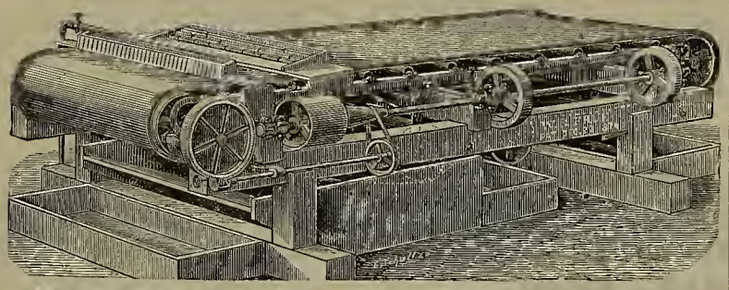
$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR,

—OR—

VANNING MACHINE.

Over 400 are now in use, giving entire satisfaction. Saves from 40 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal.

A machine can be seen in working order, and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont Street.

To those intending to manufactura or purchase the so-called "Triumph" Concentrator, we herewith state:

That legal advice has been given that *all shaking motion* applied to an *endless traveling* belt used for concentration of ores is an infringement on patents held and owned by the Frue Vanning Machine Company.

That suit has been commenced in New York against an end-shake machine similar to the Triumph, and that as soon as decision is reached in the courts there, proceedings will be taken against all Western infringements.

That the patent laws make *users* of infringements responsible as well as makers, and the public is therefore warned that there is considerable risk in purchasing any end-shake machine until our various patents have been decided.

That if there are those who for any reason prefer an end-shake machine, we can manufacture and sell to such a machine of that description, as efficient as the Triumph, and at a lower price, and no liability for infringement will then be incurred by the purchaser.

That we shall protect ourselves against any one making, selling or using any machine infringing any of our patents. Patented July 9, 1867; May 4, 1869; Dec. 22, 1874; Sept. 2, 1879; April 27, 1880. Patents applied for.

That we are, and have been, ready at any time, to make a competitive trial against the Triumph, or any other machine, for stakes of $1,000.

A Partner Wanted in a Rich Silver Mine.

A Miner of many years' experience having discovered and located a Mining Claim on a Rich Silver Lode at a place not very far distant from San Francisco, wishes to meet with some party with Capital to join him in developing same.

Can be seen at 531 California Street, room 1, where samples and assays of the Rock can be seen.

PENRYN

GRANITE WORKS,

G. GRIFFITH, Prop.

Penryn, Placar County, - CALIFORNIA.

The Granite Stone from the Penryn and Rocklin Quarries was declared by experts at the Philadelphia Centennial Exposition to be the

Best in the United States.

GRANITE FOR BUILDING PURPOSES, TOMBSTONES AND MONUMENTS,

In BLUE, GRAY and BLACK shades, supplied to order on short notice. Address,

G. GRIFFITH,
Penryn, Placer Co., Cal.

FINE PHOTO-ENGRAVING SEND COPY FOR ESTIMATE. IT WILL PAY YOU. CROSSCUP & WEST. 702 CHESTNUT ST. PHILA. PA.

EMERY WHEELS and GRINDING MACHINES.

The Tanite Company.

STROUDSBURG, MONROE COUNTY, PA.

Orders may be addressed to us at any of the following places at each of which we carry a stock.

SAN FRANCISCO, CAL.
Nos. 2 and 4 California Street.

GIANT POWDER.

MANUFACTURED UNDER ALFRED NOBEL'S ORIGINAL AND ONLY VALID PATENT FOR NITRO-GLYCERINE POWDERS.

All Nitro-Glycerine Compounds, for instance, so-called HERCULES, VULCAN, VIGORIT, NITRO-SAFETY Powder, Etc., are infringements on the Giant Powder Co.'s Patents.

THE GIANT POWDER COMPANY

Call Special Attention to their Improved Grades of Powder.

NO. 1.—The most Powerful Explosive Compound now in use here.
NO. 2.—Surpasses in strength any Powder of its class ever manufactured.
NO. 3.—This grade is a Strong and Reliable Powder, which does excellent work.

JUDSON POWDER

Is now used in all large Hydraulic Claims, and on most Railroads. It breaks much more ground, and obviates reblasting by breaking much finer. TRIPLE FORCE CAPS AND ALL GRADES OF FUSE.

☞ The Giant Powder Company have also purchased from Mr. Nobel, the inventor of Nitro-Glycerine, his latest invention, known under the name of

NOBEL'S EXPLOSIVE GELATINE

This explosive is from 50% to 60% stronger than the strongest Nitro Glycerine Compound and impervious to water. Even hot water does not diminish its strength. We are now introducing the same.

SAN FRANCISCO, SATURDAY, DECEMBER 16, 1882.

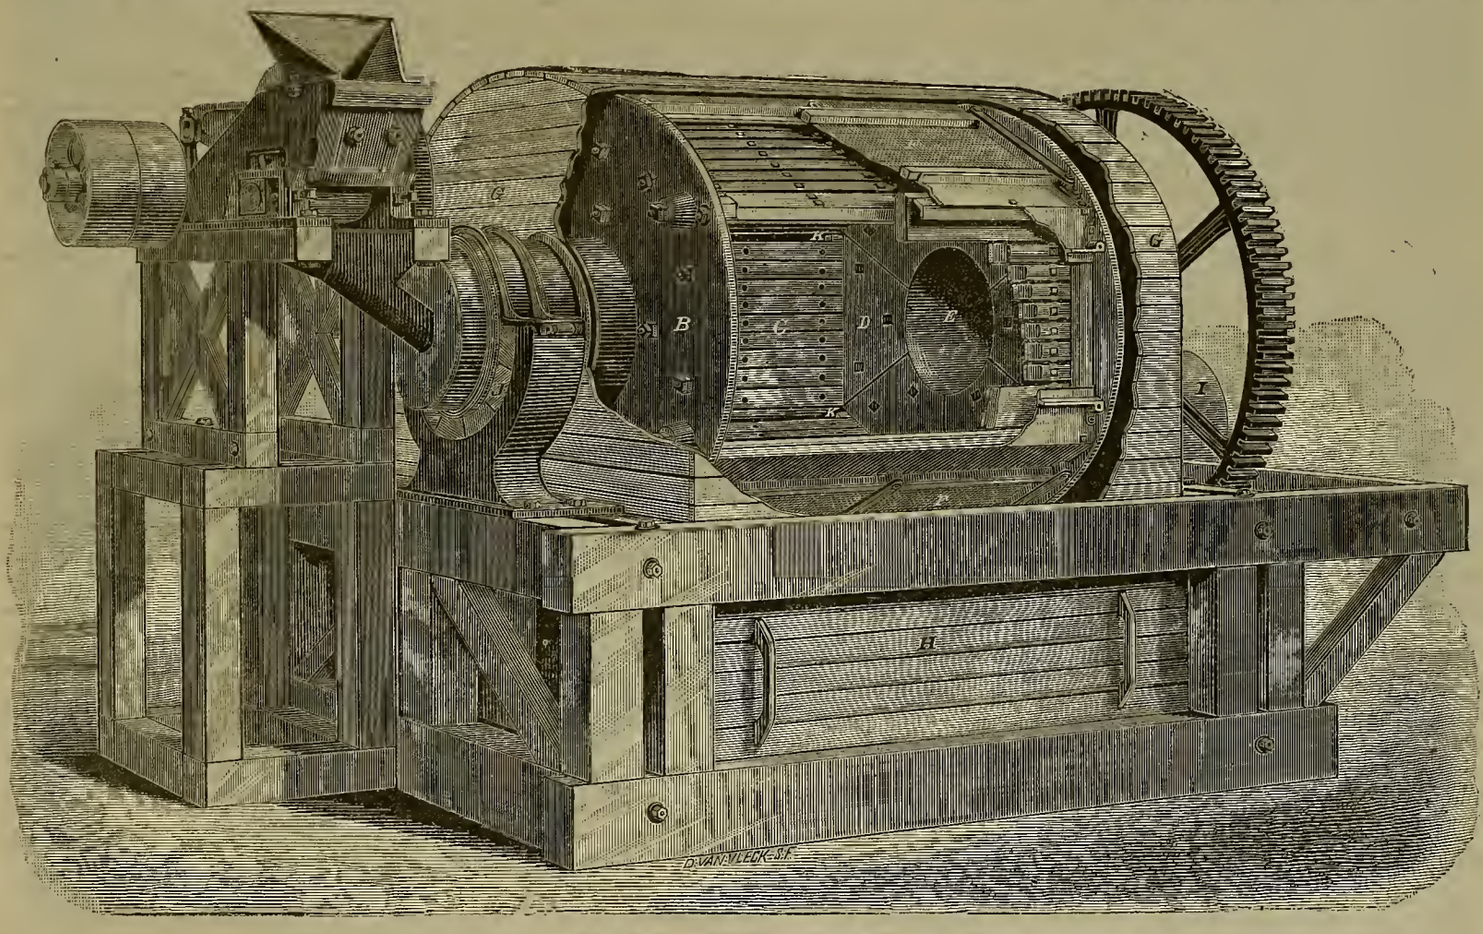
VOLUME XLV Number 25

Dodge's Ore Pulverizer.

The machine illustrated on this page has been in use in this city and at the mines for the past two years, and is not any longer an experiment. It can be seen at work every day at 143 Fremont street, where it forms part of the mechanism for a process of working ores there being carried out. Pieces of hard ore are put into the machine, and these grind the ore as it comes from the rock breaker to any required fineness. Mr. Miles B. Dodge, the inventor and manufacturer, claims that by grinding ore in this machine no "slimes" are formed, so the source of loss resulting from this is avoided.

When set up in a mill a suitable platform is erected to put the ore on and to stand upon while feeding the rock breaker, which acts as a feeder to the machine as well as a rock breaker. The work is divided between the two machines, so that they work evenly and together. A thousand pounds of the large pieces of hard ore, selected to grind the ore as it comes from the breaker, are put in at *E*, the opposite end of the machine from the breaker, and more added as these wear away and are ground up. The machine being polyhedral in shape, there is little wear upon it. The rock does not slide in mass, as in a cylindrical machine, but falls over at each angle upon itself, thus throwing the wear upon the ore instead of the machine. Whatever wear does come upon the pulverizer is on the steel lining of the grate bars *C* and check plates *D*.

The grate bars are held in place by the plates *D*, and wedges, *K*. As the ore is pulverized it passes through the grate bars to the screens, *F*, the fine powder sifting through into the box, *H*, or into covers, and the coarser particles coming back into the pulverizer through the openings under the grates at wedges, *K*. The machine must be run a certain way to allow these coarse particles to come back into the machine and be ground finer. The wooden housing, *G*, effectually confines the dust in the machine. There are tight and loose pulleys at *I*, which turn a pinion geared into the large spur wheel at 25 revolutions per minute. *J J* are the bearings in which the pulverizer rests. Three sizes of these pulverizers are made three feet, four feet and six feet in diameter. The six-foot machine is so constructed that water can be used in pulverizing. The bars which form the interior of this pulverizer are shod with steel on the wearing surfaces so that they last a long time. The peculiar angulated shape of the pulverizer induces constantly recurring falls or drops of the ore, or that there is a successive breaking and grinding action, very effective in reducing the ore. Mr. Dodge is now engaged in building two of these machines to be put into mills in this State.



DODGE'S ORE PULVERIZER AND GRANULATOR.

CAVE.—A heavy cave occurred in a "breast" in the Gleeson mine in Chili Gulch last Wednesday night, in consequence of which operations were suspended for one shift. The cave was an immense one. The cracking of the timber gave timely warning, which was heeded and nobody was hurt. The men had time to get all their tools out before the cave came down. —*Calaveras Chronicle.*

THE Blue Gravel Mining Co., Sierra City, have just let a contract for another hundred feet of their main tunnel through hard blasting rock at six dollars per foot.

Smelting Ores of Gold and Silver.

In the treatment of gold and silver ores containing copper the object is to obtain a matte or regulus which shall contain all the valuable metals. It is, however, found that with the usual methods the slag contains a certain amount of gold and silver which is lost. To obviate this loss, by securing a more complete separation of the precious metals, is the object of the invention of Richard Pearce, of Denver, Col.; and to this end the invention consists in a method of precipitating the particles of gold and silver held in suspension after the smelting is completed in the usual manner.

The operation is as follows: An ordinary reverheratory furnace is used, and, being charged with mixed ores, the ore is smelted in the usual manner. After four or five hours the ore will be found to be melted and a layer of matte or metal formed, covered by a layer of slag. The usual method would be to then draw the slag, and necessarily the particles of precious metals held in suspension would pass off with the slag. In place of that, Pearce's method consists in throwing upon the slag, as soon as the charge is perfectly smelted, fine-powdered oxide of copper, then closing the furnace a short time before drawing the slag.

The effect of this application is that a reaction takes place between the oxide of copper and particles of gold and silver, in whatever combination they may exist, and a rich, heavy matte is formed, which descends and carries with it the precious metals. For a charge of about three tons of ore about thirty pounds of oxide will serve the purpose, and in using it care has to be taken to scatter the oxide over the whole surface of the slag. In place of oxide of copper any rich oxidized copper products may be used.

To metallurgists it will be of interest to add the "claim" to this invention which was allowed by the United States Patent Office. It is as follows: "As an improvement in smelting gold and silver ores, the process of saving the precious metals usually carried off by the slag, which consists in subjecting the molten slag to the action of oxide of copper or rich oxidized copper products."

BISBEE MINING MATTERS.—Work progresses on the Mammoth and Hendricks mines. At both locations four men are working, and the copper ore, of the Mammoth, and the lead carbonate ore, of the Hendricks, continue to show up well. Notwithstanding the granting of an injunction against the Copper Queen Co. by the Prince Co., work still continues as briskly as ever. The ore body, in the eastern part of the mine, more than suffices to keep both smelters running, and everything continues as briskly as ever. The Empire has struck a body of copper ore, in doing the annual assesment work, the extent of which has not yet been ascertained. —*Tombstone Epitaph.*

THE miners at Como are still of the opinion that their camp will at no distant day be heard of in the mining world. Of late they have been finding some very fair ore, and expect ere long to send some of their bullion down the mountain.

ALL RIGHT AGAIN.—At the Soda Spring copper mine they sometime since lost their vein by a "fault" in the inclosing rock. They have found it again, and are getting out excellent ore, which is being smelted at the furnace.

The Paradise Mines.

Good Prospects in a Neglected Camp.

The recent strike in the Bullion of Paradise mine, says the *Silver State*, is again directing attention to a neglected district, which has produced more hullion than has been expended in developing its mines. The recent strike in

The Bullion of Paradise

Wae made ahout 150 feet undergronnd. The ledge has heen uncovered for a dietance of 30 or 40 feet. The vein is large, and over three feet of it carriee ore that assaye over $500 to the ton. A chunk of this ore may he seen at the expreee office. It ie rich, carrying rnhy silver and sulphurets, and coneequently somewhat refractory. As nearly as we can ascertain, ahout 50 per cent. of the assayed value of the ore is saved in amalgamating, the halance going off in the tailinge, the ore heing worked hy the wet process, without roasting. The tailings are carefully saved, and when oxidizsd can he worked to a higb percentage of their aeeayed valne at a trifling expenee. The Bullion ie the only miue in the district on which work has heen carried to any great extent for two years or more. Adjoining it, on the same lead, ie

The Wild Goose,

Which has been developed to eome extent hy a tunnel which was run to the Bullion line and then extended on the Wild Goose gronnd. The lead ie the same as the Bullion, hut the ore on the tnnnsl level is not so rich ae that recently fonnd in the Bullion. As hoth mines are worked through the same tunnel, they conld not he worked to hetter advantage if owned hy one company than they are now. Thie company doee not own a mill, and for eome time past the mine has not heen worked.

The Parad se Valley

Mine is situated a few hundred yards east of the Bullion and Wild Goose. It produced hnndreds of thousands of dollars, the ore hauled to this point and worked at the Rye Patch mill having yielded over $150,000. Snhsequently the company huilt a mill—a dry crueher—and roasted the ore. Reliahle men say there are thoueande of tons of ore in the mine of a lower grade than that roasted and worked, but it has the advantage of heing free, and could he worked hy the wet procese at a much less expense than the high grade refractory ore. The oompany etopped work over two yeare ago, and since then have done nothing on the mine except to work the annual asseesments required hy law to hold it.

Other Mines.

There are several other mines in the district, all of which are considered good prospects hy miners. Among these are the Live Yankee, Mount Rose, Red Deer and May Flower. The Live Yankee is heing developed hy Nick Frayer, whose energy under adverse circnmetances deeerves praise. From the proceeds of ore taken out of the mine he has run several hundred feet of tunnel to etrike the lead, and in a few weeks hopes to realize what his perseverance justly entitles him to.

The Mount Rose was prospected to some extent hy a San Francisco company, and is considered a good mine. Work was suspended on it hefore it was fairly hegun, and it is hoped that it will he subject to relocation at the oommencement of the year, so that a more energetic company can get hold of it.

The Red Deer is owned hy an Eastern company, and though helieved to he a valuahle mine, hecause it does not produce sufficient ore from the surface down to enahle the company to declare dividende, it remains nnworked.

The Mayflower is heing worked hy Mark Haviland, under the direction of the epirits. There is a emall streak of rich ore in the mine, and if the epirite do not mislead, and ite owner's meane are enfficient to develop it under their guidance, a large hody of ore will he fonnd ere long.

Beeidee theee mentioned there are several locations which have not heen proepected in the dietrict, and the eurface proepects for good minee are not excelled in the State. It ie a matter for general regret that the owners of the minee in which there is ore in sight do not, like the Bullion and Live Yankee ownere, do eomething to develop them, and at least work what ore can he extracted and reduced without outlay to them.

A New Dye.—The young growth of the poplar tree yielde a dye which may he extracted ae follows: The young twige and hranchee are bruieed and hoiled for 20 minutes with a eolution of alum, 10 pounde of wood requiring 1 pound of alum, in 3 gallone of water. The eolution ie filtered hot and allowed to cool, and, after etanding some time, ie again filtered from a resinous depoeit. On exposure to air and light it develops a rich gold color, and may he used directly for dyeing orange and yellow ehadee upon all claseee of goode.—*Deut. Farb. Zeitung.*

New Uses for Mica.—New ueee are heing found for mica. It hae heeen ueed heretofore principally for etove doore and lanterne, its fire-reeieting qualities and its traneparency rendering it well adapted for euch purposee. The clearest and heet eheete can, however, only he thue ueed. A patent was recently granted for a journal-hox of cement, ground mica and flour; the ingrediente are mixed, preseed into shape and then haked. A patent hae aleo heen taken out on an apparatue for reducing mica to an impalpable powder and preparing it for uee ae a mixer in starch glose and oily compoeitione.

Prosperity of Salt Lake City.

The Salt Lake *Chronicle* saye: Salt Lake City ie putting on metropolitan aire. She is simply aeserting her right as the depot and entrepot of a rich and largely extended territory. She will eon become the center of a system of railroads, inter-continental and trans-continental, whose hranches, hroad and narrow gauge, will penetrate the mining canyons and tap the vast coal fields and iron depoeits of Utah, the richeet mineral district on the continent. Her streets are crowded with representatives from every nation, from every department of production and trade. Her palatial etoree and warehoueee are plethoric with accumulations of staple and fine goode from every part of the world. Over her hank countere millione of dollars cross and recroes in ealee of mines and mining products, of real estate, and in the daily transaction of commercial and manufacturing husinees. She farnishee the largest and hest ore market on the continent, and her hankers are the middlemen through whose hands pass the outcoming millions from the two Utah minee that stand first and foremost in all the world.

From far away Idaho and Montana on the north, with Arizona and Nevada to the sonth and west, and the ecores of intervening districts pushing their dumps into the outlaying snhnrhs of the city, the mining interest contrihutes ever increasing volnmes of subetantial wealth, and through the imperial gates of this Ophir of the New World flow unceaeingly the eilver and golden streams that furnieh life hlood to the financial system of the trafficking world.

Smelters, mills, sampling works and fonndries on the confines of the city, day and night, with ceaseless clatter, transmnte huge masses of crude ore into marketahle gold, eilver, iron and lead, and long hullion trains daily wend their way over the mountains east and west, loaded with metallic treaeure from this City of the Saints.

A Body of Mica.—A Reno *Gazette* reporter has heen ehown eeveral sheets of mica taken from a depoeit discovered north of Pyramid lake, where it is said to he in ahundance, in flat veins from two to four inches in thickness. The samples shown were quite pnre and of silvery whitenese, and almost as flexihle as paper. If the material is to he found in any great quantity, the discovery is a valuahle one. To the uninformed it may appear strange, hnt mica today ie a staple article of commerce. The fact that mica used in etoves must be replaced almost annually creates a eteady demand. Ite application to shoes has recently heen patented, wherehy solee, at trifling expense, are rendered perfectly water-proof. And wherever the qnantity of mica produced ie eufficient to supply the demand and the market price is reduced, then new usee and applications of it will arise. Ae a lubricator, it etands pre-eminent, owing to its non-friction qualities. Several patente exiet in which this mineral, in a ground etate, combined with oil, ie used to lubricate machinery. The market valne of mica ie great, and at the present time the demand ie such that it cannot he supplied. A piece of mica four hy four inches, five-eighths of an inch thick, will weigh one pound, and has a market value of $4. A piece three hy six inches, one-half inch thick, will weigh one pound, and has a market value of $4 60, and a like relative portion of value exiets, excspt in the smallest pieces, eay one-half hy two inches, which have a value of 50 cents per pound, and all the refuee and trimmings of the mica are readily sold to partiee who pulverize them for use in the manufacture of nitroglycerine and other dangerous explosives. It will thus be seen that in mica mining we have an indnetry worthy of development, and one which requires no expeneive manipulatione of the product after it is mined.

A Miner's Wonderful Nerve.—Jnlius Rigo, the miner eo eerioucly injured hy a hlast in the Toughnut mine last Tueeday, ie a man poseessed of extraordinary nerve. When the diecharge took place, he was thrown over thirty feet, and notwithetanding the fearful torture he wae undergoing, he retained hie eenses, and determined to eecape from the winze, not knowing hnt what another death-dealing hlast would quickly follow. Although hie left arm was hroken and hung limp and motionlese hy his eide, hie hody covered with bruieee and hleeding from a dozen different wounde, Rigo euceeded in reaching hie fellow-workmen after traveling a dietance of 128 feet. His nerve did not foreake him even at that moment, and after his friende had conveyed him home and eummoned a phyeician. In order to eave hie life amputation of the injured arm was coneidered neceeeary, the operation heing horne with heroic firmness. At preeent the patient ie reeting easy, and will, unleee a relapee occurs, he ahle to he around in a few weeke.—*Tombstone Epitaph.*

Montana.—Montana's record for 1882 will he a euperh one. With an increase of eome 250 milee of railroad, opening to occupation the richeet mineral, pastoral, foreet and agricultural lande of the Territory, with an iocrease during the year of 15,000 permanent residente, and a thorough peace eetahlished among the red men, Montana hae in 12 monthe received that for which ehe has vainly etruggled for nearly 20 yeare. The aseeeeed valuation of the Territory hae increased ahout 30%, and such a hoom in the building of citiee and the improvement of village property wae never known. A geologiet hae predicted that Montana will eome day he the greatest coal-producing State in the Union.

Silver Interests of Globe.

A correspondent of the Arizona *Silver Belt* says: The silver interests of this district, at the preeent time, seem to he almost lost sight of in the great rush for copper, altbough they undoubtedly constitute our main wealth, and time will prove their merite to be as good as those of any other section of Arizona. The most of ue are familiar with the hietory of all the failuree. Lack of capital to develop and of proper machinery to work, or mismanagement and extravagance, have interfered so far with the succese of some of our hest mines. The majority, however, if not all of the real failuree, are traceable directly to fraud and swindling. Many of the so-called minee, upon which mills have heen erected, have no existence; in fact, are nothing more than etratas, with little or no development, and nothing in sight to warrant the outlay of a dollar; and when, on the favorahle report of an "expert" who has heen "seen," or ie a eilent partner in the sale, mills are put up and money expended, what else could he expected?

The Mack Morris, Stonewall Jackson and Centennial are not referred to. We think that "poco tiempo" they will he turning out their nsual amount of hullion. The hest producing minee known have occaeional harren spots.

Globe district exhihits definite and certain indications and proofe of great mineral wealth, hnt the large veins that nnderlie us are generally stratified on the enrface and coneiderable depth mnst he had to reach the permanent fissures in the primal rock; where the acting forces of Nature were uniform and nndivided.

Every one familiar with thie district will agree with ue that we have many mines and prospects of excellent promise that lack only the capital and the right nse of it to make them large producers—the East and West Richmond, Coplin and Pacific, Rescue, Dundee, Montaoa, Buckeye, Miama, Sherman and the Pioneer mines; the mines at Ramhoz and on Quartzite mountain, the Capital and the Sunlight mines—Black Hornet, Silver Bear and Big Injun, and numerous others equally as well worthy of mention, are among the number.

A railroad to cheapen transportation and make the district accessihle and comfortahle to approach, time, money, hrains and the application of husiness prinoiples to our silver mining and milling will sooner or later confirm all we claim. M.

Mines and Works in Arizona.

The Prescott *Courier* says: A glance through the several newepapere of Arizona will convince any intelligent person that mines now heing operated aod prospected in all the counties of the Territory are rich enough for all practical purposes. Commencing with Cochise, the minee of which county have yielded more than those of any other, we have good proof that her mines continne to produce immense quantities of paying ore which is very enccesefully treated in mille and smelters. Notwithstanding losses from fires in Tombstone, that young city is today the liveliest in the Territory. The hullion shipments denote financial health, and the progrees of town and county tell the story of wealth distrihution. Tombstone's Contention pays large dividende, and the wonderful Copper Queen still larger.

Pima county can well hoast of her Total Wreck mine with its millione in sight. Mining has enahled citizens of Tucson to make their city the largest in Arizona.

Pinal county's Silver King leads in the hullion production, hnt scoree of other minee are yielding regularly.

Graham, with her Clifton copper minee, and Gila with silver and gold, are faet improviog.

Maricopa pointe with eolid pride to the Red Rover and Vulture mines as epecimene of her "etrong hoxes."

Apache, too, hae minee of coal, ealt, etc.

Our two Colorado river countiee, Yuma and Mohave, are constant contrihutore to the river of hullion.

Our own county of Yavapai ie now happy in the enjoymeot of a eucceesful mining eeaeon. After numeroue eethacks, our minere have achieved that euccess which meane victory over hase ores and isolation. The Tiger, Black Warrior, Occident, Peck, Silver Belt, Copper Mountain and a dozen other mines are hig, rich and permanent. For want of reduction works a great deal of the ore of thie county is heing eent Eaet for treatment, a coetly way of doing, which it ie almoet certain, will not much longer have to he pureued, as men of hraine and meane are now erecting reduction worke at suitable pointe in the mountains.

When we look ahroad and note what the minee have done for our Territory, we are truly amazed. Five or eix yeare ago there were not five producing minee in the entire Territory; now there are dozene of them. The country for hundrede of miles is occupied hy minere, proepectore, farmers, etock raisere and lumher men, while new comere are all the time coming in and aesietiog in the development of a country which was at ooe time said to he worthless.

Owing to laud fraude of etartling magnitude in connection with the Osage Indiane' lande in Kaneas, the Commissioner of the General Land Office hae iesued an order euspending all cash entriee made hy engle men eince June 23, 1881, where the lands lie within the countiee of Sumner, Harper, King and Comanche.

A Promising Region.

A Broad Mining Field About to be Opened Up.

The Carson and Colorado Railroad will eoon tap an extensive region of mioing and agricultural lands. The heavy work near Summit is now all completed except one tunnel (the only one on the road, in fact), and that is now about finished. The oompletion of this tunnel will let the trains down into the great valley heyond Summit.

Already the grading is completed across the upper end of the valley nearly to Benton. Soon trains will he running to that town. Surrounding Benton is a fine agricultural country. The farmers there not only raise all kinds of grain, hut also excellent fruit. The road will give the people of this region an outlet they long have needed.

On hoth sides of the valley are rangee of mountaine that are rich in gold, eilver, copper and many other metals and minerals. Many very promieing mineral veins have for many years lain undeveloped, except the little that has heen shown up through the annual work done hy the holders. Not a few veine ehowing well on the eurface have heen located hy ranchmen, who have merely done sufficient work to hold them.

In the region into which the road is now ahout to advance are many very rich copper mines. Hitherto these have heen of no valne to their owners, hut now they will become excellent paying properties. Snitahle machinery may now he taken into this section for hoth hoisting and reduction works. Stamps will take the place of arrastras, and the hand-windlass will give way to the steam hoisting reel.

A few years ago the region travereed hy the Carson and Colorado was a waterless desert, into which few prospectors cared to penetrate. Now minere are enahled to make thorongh explorations, and fine mines are now heing found almost everywhere along the line of the road. The Mount Cora mine, near Hawthorne, is one that will at no distant day make some noise in the mining world. It ie an immense vein—is now known to he 140 feet in width.

In Garfield and Gillie Mountain districts there are scores of fine mines. In eome of these eections are many small veine that are rich at the very surface. Thus it is a fine region for poor men. There are hig veins for the capitalists and companiee, and small veins from which a man may take ont paying ore hy his own labor. This he can sell at once and get hie coin.

There are undoubtedly many places where men who mine on a small scale will he ahle to make money, but where a rich company starting to do thiogs on a grand ecale would fail.

Next summer there is sure to be a hig rush into the region now soon to he opened up. Some hig, if not wonderful discoveries are enre to be made in that country next eeason. It is a much hetter, more accessihle and more promising field for prospectore than is afforded hy Arizona, New Mexico and other far off regione. Already partiee are going into the new region heyond the present terminus of the road for the purpose of examining and securing mining and other properties. Superintendent McKenzie, of the Mount Cora (formerly of the Sierra Nevada) mine, leaves to-morrow to make an examination of the mines and mineral resources of the new region. Formerly minere thought they were doing the thing on a tolerahly large scale when they went into a country for prospecting purposee with a few pack mules. Invading a mining country with a railroad is something new in the way of "going ont proepecting," hnt the experiment is honnd to prove a grand euccese.—*Virginia Enterprise.*

Fire-Proof Architecture.—An immense amount of harm hae heen done hy the current notion that in order to make any etructnre fire-proof it muet be incombuetible. Thie idea, we think, hae heen one of the leading reaeone which has prevented eteamhoat men from attempting to make the upper worke of our river steamere fire-proof. The fallacy of the idea ie easily eeen when we coneider that oaet iron huildinge have heen utterly destroyed hy fire, and that wooden huildioge have had whole floore hnrned ont without injuring portione of the building ahove or helow. What ie needed is a etsucture which will reeist fire, and thie can he easily ohtained in wood. A wooden ehutter carefully covered with tin withetande the effect of fire longer than one of iron, and if the principle of the tin-covered ehutter can he adopted in certain parte of the joiner work of our river eteamers, they can he rendered eo far fire-proof that when flamee hreak out around the hoilers, near the engine, or in the freight, the fire will epread so elowly that it can he controlled.

At Wilcox, Ariszona, there are four hlacksmith ehope, and they keep husy repairing wagone. The hoxes of the coke wagons are eix feet high, and on eome they load 20,000 pounde, and have 14, 16 and 18 mules—draw two or three wagone—the eecond and third wagone heiog made emaller than the firet; on the eide of each wagon they have a harrel tied, and theee they fill when the watering placee are far from each other. Globe ie 140 milee from Wilcox, and it takes from 22 to 30 daye for these teame to make a round trip. More than 100 teame are hauling from Wilcox at preeent; the teamsteie go armed with rifles and pietole, for they do not know when the red-man may go on the warpath.

MECHANICAL PROGRESS.

Manufacture of Iron and Steel Direct from the Ore.

A paper on this subject was recently read before the members of the Manchester Association of Employers, Foremen and Draughtsmen, in the Mechanics' Institute, Princess street, by Mr. Vaughan W. Jones, Liverpool. Mr. J. Craven, President of the Association, occupied the chair. Mr. Jones described the operations of making pig iron in the ordinary blast-furnace, and then gave a full description of the process known as Bull's process (because invented by Mr. H. C. Bull) of manufacturing iron and steel direct from the ore. He stated that of late years the universal practice had been to produce crude cast iron in the blast-furnace, and then convert it into wrought iron or steel, either by the well-known methods of puddling, the Bessemer, or the various open-hearthed processes. The crude iron produced in the ordinary blast-furnace contained, in addition to carbon, all the phosphorus and a large portion of the sulphur which had been placed in the furnace either in the ore, fuel or flux, together with some silicon. These substances were reduced from the phosphoric acid, sulphuric acid and silica in the ore by the solid carbon present in the lower portion of the furnace. In the upper portion of the furnace the iron is reduced to a metallic state without reducing these substances, the carbonic oxide not having sufficient affinity for the oxygen to absorb the same from either sulphuric acid, phosphoric acid, silica, or oxide of manganese.

In Mr. Bull's process no solid carbon was used in the furnace, which was charged with nothing but iron ore and flux — usually limestone. The furnace was worked exclusively with gas, delivered into it in a very highly heated state direct from the producers. Highly heated air was also introduced into it in sufficient quantities to burn about 10% of the gas and maintain the furnace at the high temperature necessary to allow the withdrawal of the iron or steel and cinder in a fluid state. Under this system the gases rising through the ore and flux were carbonic oxide and hydrogen in equal volumes, together with the nitrogen derived from the air blown into the furnace. These gases being produced entirely outside the furnace, there was no zone of gasification, but only zones of fusion, reduction and carbonization. The zone of preparation was removed from the furnace by an apparatus, together with the system of heating the air, producing the gas and constructing the crucible of the furnace to support the intense heat required.

During the year 1881 the Societe John Cockerill, of Seraing, Belgium, built an ordinary blast-furnace 6 ft. diameter in the bosh and 21 ft. high, fitted with Cooper hot-air blast stoves and ordinary water-gas producers of the cupola type, when 5,354 kilogrammes of iron were produced in 24 hours under this process with the gas, as against 645 kilogrammes by means of the ordinary blast-furnace without the gas. The silicon was reduced from 3.40 to .15, the sulphur from 1 61 to .33, the phosphorus from 1.76 to 1.10, the manganese to *nil*, the combined carbon to .52, and the graphite to .17, which proved conclusively that the mildest grades of ingot, iron and steel suitable for rails, cutlery, and the highest class tools, could be produced from the *most inferior ores direct in the blast furnace*.

At the same time the output from the furnace was increased enormously, and the quantity of fuel required was decreased in almost the same ratio. In short the advantages of the process were, that iron or steel ingots could be produced in any district at a cost much lower than the most inferior pig iron under the present systems, owing to the enormous increase of the output of the furnace and the great reduction in the amount of the fuel consumed. After the reading of the paper various questions were asked as to the details of the working of the new method, and Mr. Bull replied. An opinion was generally expressed that if the patentee, in the experiments which he proposes to undertake on a larger scale than those hitherto attempted, should secure the advantages which he claims for his process, a great step in advance will have been made in the manufacture of iron and steel goods.—*London Mining Journal.*

THE INVENTOR OF MALLEABLE IRON.—To Henry Cort is usually attributed the discovery of the process for converting cast iron into malleable iron. But careful investigations have led us to the conclusion, says an English paper, that the honor is due to Dr. John Roebuck, the grandfather of the late distinguished member for Sheffield. Dr. Roebuck being a good practical chemist, his inquiries led him, when residing at Birmingham, where he practiced as a physician, to seek for more economical methods of smelting ore than those then in use. His patent specifications leave no room for doubt that he was the inventor, in 1762, of the process for converting cast iron into malleable iron. The specification distinctly states that the cast iron was melted on a hearth with a blast, and then worked "until reduced to nature." In that state it was exposed to "the action of a hollow pit-coal fire heated by the blast of the bellows until reduced to a loop," which was then "drawn out under a forge hammer into bar iron."

Glass Shingles.

A manufacturing firm in Pittsburg, as we learn from the *Brick, Tile and Metal Review*, have made a new departure in the use of glass, a patent having recently been granted to them for the manufacture of glass shingles. It is claimed for this material that it is more durable, stronger, and more impervious to rain than slate, or any other substance now used. The manufacture of these shingles will also be comparatively inexpensive, and they can be placed in position by any ordinary workman. They can be used for weather-boarding or siding houses, and will be found especially serviceable for conservatories or hot-houses, as they can be made of transparent as well as of opaque or translucent glass. These shingles have the advantage of slate in several particulars. In consequence of their shape they lie solid on the roof, and so can be used on comparatively flat roofs, and they will admit of persons walking on them without danger of fracture, a quality which slate does not possess. They are interlocked, so as to leave no interstices between them, and one rivet holds each pair of shingles, so that they cannot be forced from their places by wind or other atmospheric disturbances. They are also made so as to have very little waste material. It takes 300 slates, each 8x12 inches, to cover what is technically known as a "square" of roof (a space measuring 10 ft. each way), but 150 of these shingles will suffice for the same space. Slates lap on the ends in the roofing, but the shingles lap on the sides. It has been proved by experiment that of two adjacent houses, one covered with slate and the other with translucent glass, the heat of a room near the roof in the former building will exceed that of one similarly situated in the latter during summer by 13°, glass being a non-conductor of heat. Houses with glass roofs are also warmer in winter. Glass is likewise a non-conductor of electricity, and houses with these roofs will need no lightning conductors. Although the kind of glass intended to be used in these shingles is non-transparent, yet spaces for skylights may be filled with transparent glass. The exposed parts of the shingles are corrugated, to increase the strength and carry off the water.

Tempering by Compression.

L. Clemandot has devised a new method of treating metals, especially steel, which consists in heating to a cherry red, compressing strongly and keeping up the pressure until the metal is completely cooled. The results are so much like those of tempering that he calls his process tempering by compression. The compressed metal becomes exceedingly hard, acquiring a molecular contraction and a fineness of grain, such that polishing gives it the appearance of polished nickel. Compressed steel, like tempered steel, acquires the coercitive force which enables it to absorb magnetism. This property should be studied in connection with its durability; experiments have already shown that there is no loss of magnetism at the expiration of three months. This compression has no analogue but temperature. Hammering and hardening modify the molecular state of metals, especially when they are practiced upon metal that is nearly cold, but the effort of hydraulic pressure is much greater. The phenomena which are produced in both methods of tempering may be interpreted in different ways, but it seems likely that there is a molecular approximation, an amorphism from which results the homogeneity that is due to the absence of crystalization. Being an operation which can be measured, it may be graduated and kept within limits which are prescribed in advance; directions may be given to temper at a specified pressure, as readily as to work under a given pressure of steam.—*Chron. Industr.*

WOODEN BOLTS IN HOUSE BUILDING.—Wooden bolts in house building, and their superiority over nails, is thus commented on by an English journal: "Why do you make such a lavish use of nails in the carpenter's work of our houses, to the exclusion of the honest old oaken pin? Pull down any building, if it be merely a barn, of more than 200 years old, and you will not find a single nail in the original work; rafters and joists were all bolted together so stoutly as almost to defy the tools of the destroyer. Many an old manor barn, when pulled down of late years—as unfortunately too many of them are—has shown itself to be better built than most palaces are now. There are arguments in the way of economy of time, and so on, in favor of the use of nails in house building, but they are as nothing compared with the solid advantages of using wooden bolts. The iron nails in time canker and rot rafters and floors, but bolts hold them together 'like grim death,' and render a house practically indestructible."

IF AN ECCENTRIC SLIPS on the road on a locomotive, pinch her on the dead center, on the slipped side; disconnect the valve stem on the disabled side, and set the valve by the blow cock, so that steam just shows blowing through it, and then give her whatever lead she had originally. Then bring the eccentric round so that all parts will connect again. The lengths have not been disturbed; they are all right, and when the parts will connect, the engine will go ahead (if the valves were ever right) a good deal better than some whose eccentrics have never slipped, but ought to. Don't get excited and set the valve by the wrong end of the cylinder and then try to connect her up.—*Mechanical Engineer.*

SCIENTIFIC PROGRESS.

Atoms.

The sensation of light is produced by a succession of waves which strike the retina in periodic intervals, and such waves, impinging on the molecules of bodies, agitate their constituent atoms. These atoms are so small, and, when grouped to molecules, are so tightly clasped together, that they are capable of tremors equal in rapidity to those of light and radiant heat. To a mind coming freshly to these subjects, the numbers with which scientific men here habitually deal must appear utterly fantastical, and yet to minds trained in the logic of science they express most sober and certain truth. The constituent atoms of molecules can vibrate to and fro millions of millions of times in a second. The waves of light and of radiant heat follow each other at similar rates through the luminiferous ether. Further, the atoms of different molecules are held together with varying degrees of tightness—they are tuned, as it were, to notes of different pitch. Suppose, then, light waves or heat waves to impigne upon an assemblage of such molecules, what may be expected to occur?

The same as what occurs when a piano is opened and sung into. The waves of sound select the strings which respectively respond to them—the strings, that is to say, whose rates of vibration are the same as their own—and of the general series of strings these only sound. The vibratory motion of the voice, imparted first to the air, is here taken up by the strings. It may be regarded as absorbed, each string constituting itself thereby a new center of motion. Thus also as regards the tightly locked atoms of molecules on which waves of light or radiant heat impigne. Like the waves of sound just adverted to, the waves of ether select those atoms whose periods of vibration synchronize with their own periods of recurrence and in such atoms deliver up their motion.

It is thus that light and radiant heat are absorbed. And here the statement, though elementary, must not be omitted, that the colors of the prismatic spectrum, which are presented in an impure form in the rainbow, are due to different rates of atomic vibration in their source, the sun. From the extreme red to the extreme violet, between which are embraced all colors visible to the naked eye, the rapidity of vibration steadily increases, the length of the waves of ether produced by these vibrations diminishing in the same proportion. I say "visible to the human eye," because there may be eyes capable of receiving visual impression from waves which do not affect ours. There is a vast store of rays, or more correctly waves, beyond the red, and also beyond the violet, which are incompetent to excite our vision; so that could the whole length of the spectrum, visible and invisible, be seen by the same eye, its length would be vastly augmented.

I have spoken of molecules being wrecked by a moderate amount of heat of the proper quality; let us examine this point for a moment. There is a liquid called nitrite of amyl frequently administered to patients suffering from heart disease. The liquid is volatile, and its vapor is usually inhaled by the patient. Let a quantity of this vapor be introduced into a wide glass tube, and let a concentrated beam of solar light be sent through the tube along its axis. Prior to the entry of the beam, the vapor is as invisible as the pure air. When the light enters, a bright cloud is immediately precipitated on the beam. This is entirely due to the waves of light, which wreck the nitrite of amyl molecules, the products of decomposition forming innumerable liquid particles which constitute the cloud. Many other gases and vapors are acted upon in a similar manner. Now, the waves that produce this decomposition are by no means the most powerful of those emitted by the sun. It is, for example, possible to gather up the ultra-red waves into a concentrated beam, and to send it through the vapor like the beam of light. But, though possessing vastly greater energy than the light waves, they fail to produce decomposition. Hence, the justification of the statement already made, that a definite relation must subsist between the molecules and the waves of ether to render the latter effectual.—*John Tyndall, in Longman's Magazine.*

THE CAUSE OF LIFE.—We are getting down to it. Bioplasm, protoplasm, etc., show us the mechanical composition of certain ingredients which somehow are alive and contribute to the making up of our bodies. Up to within a few years physiology did not suspect that there was any chemical difference between dead and living protoplasm. But recent researches, beginning with an article of Pfluger's in 1875, point strongly in an opposite direction. One of the ablest essays in the affirmative was written last year by Drs. Oscar, Loew and Bokorny, and published in Munich. The result of their investigation goes to show that living protoplasm owes its property of life to the presence of aldehyde groups, which are characterized by intensely active atomic movement. When death takes place it is coeval with and caused by a transformation of these aldehyde groups into amide groups, with diminished molecular motion, thus leading to cessation of action. What causes the transformation, however, is still an unsolved problem.—*Phrenological Journal.*

The Four Forces in Nature.

Mr. George Whewell, in a recent communication to the *Journal of Science*, enunciated a theory to explain the fact that the same piece of carbon (or any other element) in different states of combination had in one case the power of motion, and was what is called living matter, and in the other case had not the power of motion, and was what is called dead. He has since furnished another article for the same journal, in which he says:

In nature we recognize four forces, which we venture to call atomic vivs, organic viva, animal viva and mensic viva (mind).

The same piece of carbon, in one condition having no power of motion, as when forming a portion of the root or stem of a plant, possesses atomic and organic viva. When it forms a portion of a nerve it possesses atomic, organic and animal viva; and when it forms a portion of the brain, and causes man to think and act, it possesses all the four forces—atomic, organic, animal and mensic (mind) viva.

We assume that the elements contain these four forces in a state of activity or otherwise, according to circumstances. When the element belongs to the mineral kingdom it possesses only atomic viva, the other three forces being latent. When it belongs to the animal kingdom the other three are either active or latent, according to the circumstances—that is, according to the position they occupy in the body of a living animal or plant.

Take the life history of our theoretical molecules of carbon. Suppose that a molecule of carbonic acid gas floats about in the atmosphere, and is driven hither and thither at the caprice of every wind that blows. In this condition atomic viva is alone active, the other three being latent. In its passage over the earth it strikes against the leaves of an edible plant; the sun is shining, and the molecule of carbonic acid gas is absorbed by one of the leaves of the plant; the carbon is retained, and the oxygen is given off again. The carbon becomes a portion of the substance of the plant. It has changed its condition from being a portion of a poisonous gas to be nutriment for man or animals. From being a portion of dead matter it becomes a portion of living matter. The gardener takes the plant, cooks and eats it; by and by it is converted into blood, and is then in a condition to have its latent forces developed. It can become a portion of a muscle, and possess atomic, organic and animal viva, and be a portion of a living body. It can become a portion of the brain, and produce thoughts—violent, demoniac or sublime—at its own caprice. In this condition it possesses all the four forces in a state of activity. When it has produced these effects it again becomes carbonic acid gas, and finds its way into the outer world to be tossed hither and thither at the mercy of the winds.

This same molecule of carbonic acid gas may go through this endless change from century to century.

New forces must of necessity develop and become latent in the molecule in passing through this endless variety of change.

EARTH CURRENTS AND TELEPHONES.—Mr. Preece pronounces the venerable theory that the earth is a great reservoir of electricity, from which either positive or negative electricity could be extracted at will, exploded. Currents are traversing it. The return current of telegraph lines, one wire of which is grounded, can be picked up as it traverses the soil. Telephones placed in the attic of a building and connected on the one hand with the gas pipes, and the other with a wire coming up from the ground floor, have been found to steal the messages sent from a telegraph office 250 yards away. Several cases are known where telephones have picked up messages from telegraph lines miles away. It is therefore desirable that the earth should not enter the telephonic circuit. When electric light wires are grounded this is seen to be not only desirable but essential, and in case of a thunderstorm, the expediency of cutting the earth out is shown to be of the highest order. Every flash of lightning, no matter how far off, is indicated when the earth forms part of the telephonic circuit. There are "earth currents" which are at times so strong that when taken up by the telephone they make a noise "as if your brains were boiling." These are, however, so weak ordinarily that the telephonist has little to fear from them.

ICE.—There are many remarkable things connected with the formation of ice. A lump of ice melted becomes distilled water. The fact that it is lighter than water is probably caused by its power to remove all impurities in the freezing process, and thus diminish its weight. Salt, air and coloring matter are expelled. Water colored with indigo will form ice as clear as the purest rain water. When there is a sudden fall in the temperature foreign matter have no time to escape, either by falling or rising, and are consequently entangled with the ice, but do not form any portion of it. Salt water gradually frozen will produce fresh water ice; but in the Arctic regions, where the temperature sometimes falls from 40 to 50 degrees in the course of a few hours, the frozen salt water when melted will not produce perfectly fresh water, on account of the particles of salt adhering to it in the rapidity of the congelation.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports :

Christy, Dec. 6th, $5 403; Standard, 4th, $14,954; Standard (for November), $81,153; Christy (for November), $39,038; Star, Dec. 6th, $4,288; Bodie Tunnel (for November), $12,.000; Gold Hill, Dec. 3d, $30,000; Horn Silver, 5th, $22 500; Germania, 5th, $4 400; Hananer, 5th, $4,200; Horn Silver, 9th, $12,500; Hanauer, 9th, $2,270; Crescent, 9th, $4,980. The report of the Assessor of Storey county for the quarter ending Sept. 30, 1882, shows that the hullion yield of the Comstock mines was as follows during that period: Union Con., $74,955.54; Ophir, $27,377.72; California, $7,645.79; Belcher, $74,-258.97; Crown Point, $106,567.20; Confidence, $3,699.37; Challenge, $1,198.50; Con. Imperial, $9,156; Kentuck, $55,652; Yellow Jacket, $14,-963.97. Total, $375,175.60.

THE Connecticut Legislature has voted $50,-000 for a soldiers' monnment.

MINING SHAREHOLDERS' DIRECTORY.

Compiled every Thursday from Advertisements in Mining and Scientific Press and other S. F. Journals

Mining Share Market.

The market has been very dull for the past week. The depression in tho Bodie mines has had a had effect on prices. Nothing much has come out of the Comstock lately either. The completion of the connection between the main north and south drifts on the 2900 level of the Mexican and Union Con. mines opens up to exploration a vast area of virgin ground on either side. The work of prospecting this ground will be commenced at once.

The joint Ophir and Mexican winze will soon reach the 3100 level. Progress is slow at present owing to the ground in the bottom being a conglomeration of quartz and porphyry, which does not blast well.

At the Chollar the main south drift on the 2600 level is in softer rock, and its course has been changed from the south to the west. In the other middle mines active operations are in abeyance. At the Gold Hill end of the lode the Yellow Jacket, Crown Point and Belcher companies are still extracting low-grade ore from their old upper levels.

It is again reported that arrangements have been made by which work will in a few days be commenced on the drain drift leading from tha Alta to the Sutro tunnel.

News in Brief.

THE whole State of Chihuahna, Mexico, is in arms against the Apaches.

WASHINGTON TERRITORY boasts of being out of debt with money in the Treasury.

THE loss by the fire in London Thursday night is estimated at £3,000,000.

A RAILROAD is to be built from a point in the San Joaquin valley to the Calaveras Big Trees.

A SOLID piece of gold weighing 152 ounces was found in a placer claim in Del Norte county last week.

THE State Prison Directors, who illegally collected mileage, have returned the amount to the State.

THE German Government persists in its determination to prohibit the importation of American pork.

ONE out of every 10 of the inhabitants of Chester, England, has, it is asserted, joined the Blue Ribbon army.

PROF. BOSS sends word from Santiago that the American observation of the transit of Venus was completely successful there.

THE New York brokers have appointed a committee to consider a plan for a clearing house in connection with the Stock Exchange.

THE German Government will oppose the bill taxing hourse transactions. A large number of the bankers will transfer their business to foreign places if the hill becomes a law.

Recent Contributions to the California State Mining Bureau.

[Furnished for publication in the MINING AND SCIENTIFIC PRESS by HENRY G. HANKS, State Mineralogist.]

[CATALOGUE.]

4376. Blue Limestone or Marble, with veins of white—Peuce, Butte county, Cal. It is soluble in hydrochloric acid with effervescence, leaving a small hepatic residue—when struck with a hammer it emits a fetid odor—anthraconite; burns to a pure white lime, which slacks perfectly. This stone is well adapted for building purposes, as a ue fut and ornamental stone, valuable also for manufacturing purposes.

4377. Rough Diamond—Probably from the African diamond fields; used in salting the ground in the well-known diamond swindle. Donated by H. Elsau.

4378. Silver Spanish Dollar—Coined in 1806, Carolus IV., del Gratia. Dredged from the wreck of the Spanish line-of-battle-ship *San Pedro de Alcantara*, of 100 guns, which in the year 1815, was burned off the islands of Coche, Cubagua and Margarita, coast of Venezuela. Of the 1,300 men on board, 1,000 lost their lives. The wreck lies in nine fathoms of water, and the money scattered by the explosion was found in eight fathoms of water. Records in Spain show that she had $1,000,000 on board. In 1846 $200,000 were recovered by the use of diving belle. In 1880 Mr. T. H. Folingsby, with a dredger of his own construction, collected $2,000, of which this is one, and by him donated to the State Museum.

4379. Copper Ore—Santa Fe district, six miles from Luning, Esmeralda county, Nevada. J. H. Crossman. The bright red portion consists of the oxides of copper and iron, and is probably "tile ore," or "Ziegelerz" of the German mineralogists.

4380. Galena, Sulphide of Lead, said to exist in large quantities and to contain $150 per ton in silver—Goldwin bay, north of Norton sound, Alaska. Alaska Gold and Silver Mining, Milling and Trading Co., Col. A. F. Williams.

4381. Foesil Ferns, Carboniferone—France. Henry G. Hanke.

4382. Iron Ore, Hematite and Limonite—Potter's iron mine, bank of Pitt river, one mile from the fisheries. E. P. Figg.

4383. Magnetite—Potter's iron mine, bank of Pitt river, one mile from the fisheries. E P. Figg.

4384. Indian Mortar of Porphyry, showing unusual skill in construction, and of a very hean t utand unusual material —Found near the forks of the Salmon river, Siskiyou county, Cal. Hon. John Daggett.

4385. Indian Pestle—Found near the forke of the Salmon river, Siskiyou county, Cal. Hon. John Daggett.

4386. Pyrite, containing also Sulphide of Copper in small quantities, called "white ore"—San Francisco copper mine, Spenceville, Nevada county, Cal. John E. Ellis.

4387. Copper Ore, selected, prine pally Chalcopyrite—San Francisco copper mine, Spenceville, Nevada county, Cal. John E. Ellis.

4388. Copper Matte—Concentrated by roasting in beaps; allied to orubeeite. By this process the rich copper matte forms a kernel in a mass of the protoxide of iron. San Francisco copper mine, Spenceville, Nevada county, Cal. John E. Ellis.

4389. Copper Ore Roasted—San Francisco copper mine, Spenceville, Nevada county, Cal. John E. Ellis.

4390. Copper Cement—Metallic copper in the form of a powder, precipitated from solution by scrap iron; iron replaces the copper in the solution, forming sulphate of iron, while the copper falls; is dried and shipped to a market. San Francisco copper mine, Spenceville, Nevada county, Cal. John E. Ellis.

4391. Stone Hatchett—Celt—County Antrim, Ireland. Dudley C. Stone.

4392. Fruit of the pochote tree. It is a pod about 10 inches long, tapering at the ends, and swelling in the center to two and a half inches in diameter The shell is secured by wires to keep the contents confined. Mr. Noel Marlotte, who donates this specimen, says: "Take off the wire around it and leave it in a quiet place; in a few days it will open. The inside is like beautiful silk. In time separate the silk from the shell that it may not be stained by it. The silk is so light that if you do not put it in a glass case, it will all blow away." In Mexico the silk fiber is used for filling pillows, cushions and even mattresses.

OWING to the statement that China is making great preparations to resist the French designs on Tonquin, the French Government is urged to take active measures. A telegram from Saigone reports that 10,000 Chinese have crossed the Tonquin frontier.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

LAMPING GRAVEL CLAIM.—Amador *Ledger*, Dec. 9: A company of Eastern capitalists, represented by P. A. Lamping, have gone into the mining business in Ione valley on a larger scale than has been attempted in that section for many years. The field of operations is on Mule creek, about one and a half miles from ranch and three and a half miles from Ione City. The land is owned by the Grant company, but 40 acres have been leased for a term of 10 years for mining purposes. These 40 acres comprise what is regarded as the best auriferous land in that vicinity. Its gold-bearing character has long been known, but it cannot be worked to advantage by the ordinary methods of gravel mining, from the fact that the country is level; there is no natural fall; no gravel bank, and, consequently, no dumping facilities. In addition to these drawbacks, the payclit is buried under from 20 to 25 feet of alluvium. Owing to these formidable obstacles, the seam of pay gravel has remained comparatively unmolested, although a few miners have usually been found scratching around in that neighborhood during the rainy season. The present company, however, has started in to work the claim in a thoroughly scientific manner. Mr. Lamping went East a few months ago, and purchased the necessary machinery in Philadelphia, at a cost of something like $15,000. This machinery consists of a 40-horse power engine, a dozen scrapers to be operated by steam, and a quantity of other apparatus. Most, if not all, the machinery, is now on the ground. From 20 to 30 men are employed at present, under the formansbip of Wm. Gay, getting the claim into working order. A number of scrapers, operated by horse-power, have been running for some time, scraping off the top dirt. The point of operation is about the middle of the 40-acre tract. It is slow work to strip off a layer of earth 25 ft in thickness, but when a hole is once made to the bed-rock the subsequent working will be comparatively easy. A number of carpenters are at work putting up a boarding-house, blacksmi h shop, building flumes, and so forth, and the place has the appearance of a small village suddenly called into existence. The enterprising company has purchased the old McDonald ditch, which brings water from Dry creek, and when in full blast it is expected to use 600 inches.

BUTTE.

FAV RABLE OPPORTUNITY FOR QUARTZ MINING.—Oroville *Mercury*, Dec. 6: A few days since we happened upon a locality that looks exceedingly favorable for a profitable quartz mining operation. It is some 10 or 12 miles northeasterly from Oroville, and near the head of a ravine that flows northerly into the west branch of the Feather river. In a small valley, several hundred yards wide, for many years has mining been carried on by drifting—shafts having been sunk along its entire length a depth of from 50 to 70 ft, and a stratum of earth, evidently the abrasions from a large quartz ledge that overhangs the eastern side of the valley, raised to the surface and washed in sluices. The gold, being scraggy and rough, shows that it has never been carried far from the parent matrix after having been freed. Upon the adjacent hillside the large quartz vein is seen cropping for a long distance, and it "prospects" in many places. Three thousand feet of this vein is held by U. S. patent, obtained a number of years ago. In early times there was a stamp mill erected, some thousands of tons of ore crushed from the surface, that is said to have yielded from $25 to $80 to the ton, but from some cause or another the old story of extravagance or incapacity—the mill ceased to crush up the quartz, fell into disuse, and finally wound up in litigation and removal of the wreck. That, however, was many years ago; and still yet a number of years since, when the present owner came into possession, he put in operation several arastras and worked the rock with profit. But he thought to tap the lode at a depth of several hundred feet, and for that purpose drove a tunnel into the hill a distance of 640 ft, without striking the ledge, however. Not far from the starting point of the tunnel a stratum of abraded material was encountered, which for a number of months was worked in the arastras, yielding from $6 to $10 a ton. It was a slow process with only two arastras, and both reducing only a ton a day on the aggregate. Other quartz interests called the owner away, and work was stopped, and the quartz mine has lain idle through the long years that have followed. There are untold thousands of tons of just such material as has been worked with the results above mentioned that can be delivered at the stamps for $1.50 a ton. The progress of time has whitened the owner's hair, but has not diminished his faith in the value of the property; but as he is drifting the gravel in the valley, and making a living at that, he feels that it would be unwise for him to attack the quartz without greater capital than he has with which to erect proper reduction works. He offers to let persons of means prospect it as long as they wish, and will make favorable terms with them for the sale of the mine if they like it. A few dollars expended would test it sufficiently. If there is no mistake in the reports of former yields, it is certainly one of the best chances in the State for a small capital, as there is practically no limit to the ore. If this should meet the eye of any gold quartz mining man of business, who thinks favorably of it, we will be glad to place him in communication with the owner.

ITEMS.—The Indian Spring drift mine, located near Magalia, in this county, improves in richness the farther the channel is worked. This channel is now about 35 ft wide, and pays from rim to rim. The ancient stream, to which this is the bed, now capped with some 300 ft of lava, has been penetrated now nearly 2,000 ft along its course, and forms one of the most interesting of mining properties, aside from its values in golden wealth. Prehistoric relics are found in the gravel, such as elephants' tusks, bears' tusks, and other fossil remains.... The Channel claim, also near Magalia, has been compelled to close down on account of encountering a too heavy body of water for the present machinery to raise..... The Magalia mine is working a full force, and yielding about as usual.

CALAVERAS.

WEST POINT.—Calaveras *Chronicle*, Dec. 9: Our mines still continue to change hands. Capitalists are taking a firm hold upon a few of our prominent mines, to determine their value, prior to investing heavier, and in most all cases have succeeded beyond their expectations. It has been known for years past that the West Point quartz mines were rich on top, and were mostly all worked down to the water level. The lodes or veins are not large, varying from 1 to 4 ft, but rich in proportion to their width, and of course to work them under water requires capital. It was at first thought that the gold gave out when hard ground or water was reached, but such is not the case, for it has been often demonstrated that the rock is fully as rich hundreds of feet below the water level as it is at or near the surface. All that is required to make our mines pay good dividends to those who invest in the development of them is capital to furnish both the latest improvements in the mining and milling of the quartz.

EL DORADO.

ANOTHER AND A SPLENDID DIAMOND.—*Mountain Democrat*, Dec. 6: In the Green Mountain claim, near Cedar Ravine, a few days ago, Captain Ames, of this city, found a large and handsome diamond, larger than an ordinary pea, without defect in color, and remarkably clear. There is a small flaw on one side, but it will dress down to a very fine gem of much value. Of course no exact estimate of its value can be made until it shall have been dressed. This and previous finds establish beyond doubt that an intelligent search for diamonds in the Smith's

Flat and Cedar Ravine regions would be well rewarded. Several years ago, in the same Green Mountain claim, D. J. Knighton found a stone nearly or quite a half inch in diameter, of a pale straw color, which was doubtless a diamond, but he had no idea that such was the fact, and gave it away to a gentleman who was then in the drug business here

INYO.

MODOCK.—*Independent*, Dec. 9: The Modock furnace at Lookout is running steadily, but we will have no reports as to the output until the run closes. Superintendent Fitzgerald is again prostrated with an attack of the rheumatism, which is probably aggravated by the lead fumes with which he is surrounded.

MINING SALE.—A deed was placed upon the county records to day, at request of the Secretary, A. Straus, of New York. Edward Reilly sells and transfers to the Argus Range Silver M. Co. the "Bonanza King," the "Nevada" and the "Star" mines, the water rights and the mill, all situated in Sherman district, in this county. The consideration named is $500,000.

THE MONTEZUMA.—Mr. S. D. Woodhull, the metallurgist in charge of the smelting works at the Montezuma mine, was here last Thursday, en route to San Francisco. He goes with a commission and instructions to purchase and ship up a complete new water-jacket for the works, to replace the old one, which has proven about as bad a failure as was predicted of it by those best acquainted with the business. After completion of the works, they were started up November 25th, and run off and on up to the 3d inst., when, from inherent defects in the jacket, it was closed down and is to be thrown out. Twenty-five bars of bullion were produced, which assays $193 silver and $28 gold per ton. It has been clearly demonstrated that it is perfectly practicable to profitably melt the ore with something like modern appliances, which are to be put in at once.

THE "FERD MINE."—Referring to our item of a few weeks ago, it seems necessary to make some corrections of the statement then made. Mr. J. F. Hutchinson says the present owners—R. C. Chambers, W. A. Bolinger and himself—have bonded the mine for 40 days to a New York company, for $300,000, reserving a one-tenth interest. Seven miners are now employed at the mine. A mining expert will shortly make a thorough examination of the property in the interest of the new company.

CHRYSOPOLIS.—Mr. A. McKillips has been doing the annual assessment work on the gold mines at Chrysopolis, with most favorable results, in one instance at least. A new cut of 25 ft in length on the old Chase mine shows a fine 2-ft ledge of gold ore, the quartz being stained with iron and black and gray copper. The property is now owned mainly by J. T. Barlie, of New York, to whom it has been deeded by the Index Company. Mr. B. is expected here shortly.

MONO.

SITUATION IN BODIE.—*Free Press*, Dec. 6: There were no new developments in the situation as regards the south end mines on Tuesday. Many of the men lately employed in the Noonday and Red Cloud mines would now be leaving town and seeking employment elsewhere cou'd they immediately receive their last month's wages. Checks have been issued to such of the employees as choose to receive them; but as Noonday checks were protested in San Francisco last Saturday, many of them prefer to take advantage of their illegal fearing teat they would forfeit the latter by accepting checks and signing receipts. Superintendent Taylor expresses the opinion that the men would be paid and the local bills liquidated as soon as matters could be straightened out. This would certainly be a great relief to the miners and people in business here The town was full of rumors during the day —some to the effect that other mines had been attached, others that work was to be resumed at once at the Red Cloud, and many others too silly for repetition—but none of them could be traced to any definite source. The only attachment other than those of the Noondays and Red Cloud was placed on the Oro mine Monday evening, for the sum of $1,100, at the suit of the Bodie and Benton Railway and Lumber Co. As the Oro Company owes nothing of consequence beyond its current monthly bills, and no other attachments followed that of the railroad company, it is probable the $1 100 will be paid and the mine resume operations, as it has never looked better than at present. People generally, while recognizing the full extent of the calamity, are inclined to take the most favorable view of the situation, and Tuesday evening, being the night of pay-day, Main street was unusually lively and animated.

PATTERSON DISTRICT.—Bridgeport *Chronicle*, Dec. 9: Outside of the work on Summers' mines there is very little being done in this district. Most of the assessment work has been done on the innumerable locations in the district, and all things have been made snug for the winter. At Clinton, Summers' little 5-stamp mill is pounding away and making its regular weekly shipments of bullion. The Summers' Kentuck mine is turning out great quantities of fine milling ore, and enough to keep a 20-stamp mill running day and night. The mill building is being enlarged for the addition of more settlers and pans to the machinery. The Patterson is destined to be —and very soon—one of the leading mining districts on this coast, as it only requires capital, well directed and energetically manipulated, to bring to the front a score of paying mines; and now is the accepted time for capitalists, as the present owners in the district are disposed to give moneyed men a good show to invest in good properties. We learn that H. A. Whiting, Superintendent of the Bodie Con. mine, has bonded a mine in Silverado Canyon, and will commence work on it at once. A large number of substantial buildings for business and residences have been erected at Clinton the past summer, and that place now presents quite an imposing appearance, and shows that the people have the utmost confidence in the mines of that district.

NEVADA.

THE EAST EUREKA MINE.—Grass Valley *Union*, Dec. 8: Some time ago the O'Connor mining property, of this district, the ownership of which is held in San Francisco, was bonded by Grass Valley parties, who subsequently put the 20-stamp mill in repair, reopened the shaft, which had been sunk to the depth of 180 ft, and extended the level, which had been partially opened to that depth, to a distance of 400 ft. The explorations which have been made have convinced the bonders that the property is a valuable one, and they have determined to form an incorporation for the definite purchase of the property and continuance of the working of the mine. For this purpose a prospectus has been issued, which proposes to organize a company with a capital stock of $1,000,000, divided into 100,000 shares of the par value of $10 each, 40,000 of the shares to be placed in the treasury as a working capital, to be sold at the price of $1 per share, payable in installments.

WATER POWER AT THE MARYLAND MINE.—Grass Valley *Union*, Dec. 9: The bringing of water into this district by means of the new ditch now being built by the South Yuba Canal company is likely to work quite a revolution in the use of power at mines and mills. In addition to the Idaho company, which will use water for hoisting, pumping and milling, the Maryland company has also determined to use water, taking it out of the ditch and running it into a reservoir about half a mile east of the mine, and at an elevation of 350 ft above it. From the reservoir the water will be conveyed in a line of 15-inch pipe to the mine, and the pipe laid down the main shaft to the drain tunnel level (which is about 125 ft from the surface), at which point a chamber will be cut in which to set up a water wheel, that will do the pumping and hoisting when the shaft is sunk below that level. The power will be sufficient to sink the shaft to the depth of 000 ft. The work of cutting out a chamber for the water wheel will be commenced immediately after the holidays, and the building of the reservoir and the laying of the pipe will be deferred to the spring months. By the use of water power the Maryland company expect to get a pumping and hoisting rig at one-fifth the cost at which steam works of equal capacity would cost, and the daily expense of running which would be merely nominal. When this improvement is completed the work of sinking the shaft below the tunnel level will be continued.

A BIG CLEAN UP.—A clean up of 50 loads of quartz from the Lowrey mine, on Winchester hill, has just been made at Southern's mill, which yielded $77,500, or $350 per load. The quartz was taken out by five men in one month's work. This is a splendid result, and speaks well for the little mine, which has almost invariably turned out good crushings. The previous clean up from this mine, a little over one month ago, gave a net profit of $4,000. The location of the mine is in south Grass Valley, which is just beyond the southern boundary of the incorporation.

TAKING OUT GRAVEL.—*Transcript*, Dec. 6: The Cold Spring company are now drifting in good gravel at their mine near Willow Valley. Considerable work remains to be done before breasting can be commenced.

PLACER.

LINCOLN COAL MINE IMPROVEMENTS.—*Herald*, Dec. 9: At the Lincoln mine the new hoisting works, now about completed, are 65 ft high. The pumping machinery has been started, and as soon as the mine is dry the work of extracting ore from the new shaft will commence. The coal is found to be much better by being seasoned, and for this purpose a large new coal bunker is being built, 200 ft long and 17 ft wide, and calculated to hold about 50 car-loads of coal. It is built above the ground, with an inclined bottom and slide doors, that cars may be run along the side and loaded without the labor of handling the coal.

THE GOLD BLOSSOM QUARTZ MINE.—The neighborhood of the Gold Blossom quartz mine, a short distance below Ophir, is beginning to look like a small town. Superintendent P. C. DuBois seems to be a very active, energetic and thorough man, and from the amount and character of preparatory work he is doing he must have implicit confidence in the merits of the mine. In addition to the small dry crushing machine which was on the property when the present company purchased it, they have put up steam hoisting works and covered them in with a suitable building; they have built an office, a small stable, a blacksmith shop, a good boarding-house, and are now putting up a 10-stamp mill on the most modern and improved plans, with four concentrators and a fine large furnace, covered in with a large building, on the plan of those that work so well in Amador, for roasting the ore. Some of the rock tested in a similar furnace to the one they are constructing yielded about 90 per cent. of the assay value, and went somewhere into the hundreds of dollars per ton. The ore is very highly sulphureted, has a remarkably fine appearance, and assays rich. While all this work is going on on the surface the work of opening the mine is not neglected. The hundred foot levels, one now in about 90 ft and the other about 120 ft, are being extended, while a force are engaged constantly in sinking the main shaft. There are now about 350 tons of ore on the dump, mostly taken from the shaft and the levels, which is estimated to go, including the sulphurets, about $30 per ton. At the very bottom of the shaft the ledge is about 4½ ft thick, and at this point and at the extension of the drifts the quality is equal to any previously taken out. In the construction of the mill Mr. DuBois has been fortunate in securing the services of Mr. G. A. Deckstadter, a first-class millwright. His machinery and castings he is getting from the Marysville foundry, where he found he could make the best bargain.

PLUMAS.

GREEN MOUNTAIN MINE.—Greenville *Bulletin*, Dec. 6: The great depression in the stock of this mine as reported from New York has led to some rumors that the supply of ore in the mine is giving out. There is no foundation for any such report. There is an abundance of ore in the mine; every stamp can be supplied for an indefinite time; the ledges (for there are more than one) are as wide as ever, and show no signs of diminishing. Whatever influence may be at work in the stock boards does not affect the real value of the mine. So far as our local interest is concerned, it would not matter if the price of stock went down to almost nothing. The same number of men will be employed, the same amounts paid for labor, and consequently the same amount put in circulation here. The gamblers may pursue their schemes and their victims be fleeced; it won't affect us.

MONITOR MINE.—A new building has just been finished at the mine, to be occupied by the Superintendent as a dwelling and office. Large sheds are now being built for storage for mine timber during the winter. Ore is now taken from the lower level. The ledge is 15 ft wide. With a large mill, the whole of this would be crushed, but with only 10 stamps, as at present, the best ore is selected, and the remainder is sent to the waste dump. About 5 ft of the ledge is saved for milling. The average width would average fully $50 per ton. The yield of bullion from the mill is now better than at any previous time. From the lower tunnel to the surface there are 700 ft of backs.

CRESCENT MINES.—The first clean-up at the Crescent mine gave an average yield of $30 per ton of rock crushed. The ledge last found is now opened 250 ft in length. A shaft will soon be started lower down on the flat than the present workings, and from this crosscuts will be run to all three of the veins, that are known to run parallel and near to each other. The more this mine is opened up the better it shows. Handsome specimens, rich in free gold, can be picked up from the dump at any time.

TAYLOR PLUMAS MINE.—The new mill is all enclosed; the battery frames are well under way; the flume from the ditch is completed down to where the pipe will begin, and the trench for this is dug. The head of water will be equal to about 200 ft vertical fall. If the work continues to be pushed with equal energy, the mill will be ready to start up on New Year's day.

SIERRA.

BRIGHT PROSPECTS.—Sierra *Tribune*, Dec 7: Sierra City has every prospect of becoming the leading town of the county. Many flattering developments are being made in the mines in that vicinity. At the Marguerette mine 65 men are employed at present. The new tunnel (at the river) of the Sierra Buttes company is being vigorously worked ahead, and the indications are that in two years all the immense works of that company will be removed to Sierra City, thus greatly adding to the population of that town. Another extensive enterprise is the Phœnix quartz mine, which has been started up. We understand that this claim has been, or is to be, sold to a Boston company. Its location is similar to that of the Sierra Buttes, affording every advantage in working it. A mill site has been selected, and the company will proceed at once to make preparations for the erection of machinery. Many other companies are also prospecting for gravel in that section, and quite recently some very fine prospects have been encountered.

CENTENNIAL.—*Mountain Messenger*, Dec. 2: The Centennial gravel mine is located above Minnesota, and owned by T. Ellis, F. X. Lebonte and one other gentleman. They have several tunnels into the claim, but not much pay has been found. The owners think they have been running with the rim, and will prospect in a different direction this time.

GOOD PAY.—The cheering news comes from Howland Flat that the Bonanza company are now in good pay gravel, and believe they are again on the continuation of the old rich main channel. We sincerely trust this may prove true. No company has labored under more adverse circumstances than this one, searching for their lost lead, nor better deserving of success.

SAVAGE.—There is no truth in the report that the Savage company had struck slate in their tunnel, still in hard granite. They did have, according to report, a small streak of softer granite, but it did not amount to much, and there is no immediate prospect of anything but hard granite.

RUBY.—The Ruby company has got nearly all its winter supplies in, and expects to work from 30 to 40 men this winter. For the past week they have been principally engaged on repairs. Tuesday morning the company sent below a nice bar of gold. A contract has been let to U. Archambault & Co. to run 200 ft of bedrock tunnel towards the Bald Mountain line, starting some 50 ft below where the company are taking out gravel. The grade of the channel is south, and it is expected that this tunnel will strike gravel at the line, about 1200 ft from the point at which they are now working. The company will raise up from this tunnel every few hundred feet, and work back or up grade. A breast is also being carried north towards Rock Creek.

TRINITY.

A TRIP.—Shasta *Courier*, Dec. 0: One of our old miners and prospectors has just returned from a trip to Trinity county, where he has inspected several mines. At the New Brunswick mine everything was found in good shape and fine working order, with ore from and in the mine giving evidence of a rich harvest for its owners. Leaving here, Shafter's was next visited, where a good showing of rich ore was found, both in the mine and on the dump. Olney Phillips mine, on the Shasta side of the Divide, was next visited, and here were seen sights that would delight the eyes of the most avaricious miner that ever lived, for Phillips, after working a seam that prospected well, has at last struck a ledge that is exceedingly rich, in fact, as the miners say, "just lousy with gold." Our reporter then wended his way from here to the Black Bear mine, on the Deadwood side of the Divide, where he found a 10 stamp mill busily engaged in pulverizing rich paying ore, of which there is plenty both on the dump and in the mine; everything here was looking, working and paying well. Frick & Davis mine was the next one visited. This is the mine these gentlemen bought of Gipson & McDonald, by which they have secured a bonanza, far in excess of their anticipations; the ore is exceedingly rich, and the mine bids fair to prove next to inexhaustible. Having gone in that direction as far as he could with the limited time at his disposal, he crossed the mountain to Eastman's gulch, where he visited the Baker & Hickey ledge, now owned by Hickey, where, lost in wonder and amazement, he stood and looked upon the richest body of ore probably to be found in Northern California, which can best be described by the single word—immense.

NEVADA.

WASHOE DISTRICT.

MEXICAN.—*Enterprise*, Dec. 9: The connection between the northwest drift on the 2900 level and the main south drift on the same level of the Union Consolidated has been completed. This connection opens up to exploration a great length of ground on the vein.

UNION CON.—The main south drift on the 2900 level being connected with the main northwest drift on the 2900 level of the Mexican, over 2,000 ft of ground on the lode is opened up to exploration.

SIERRA NEVADA.—Good headway is making in both the east and the west crosscut from the main north and south drift on the 2700 level.

OPHIR.—Good headway is being made in the main south drift on the 2900 level. The work of putting in the new pumping gear is going on well.

YELLOW JACKET.—The water has ceased to rise at the new shaft. At the Winters shaft they are extracting 40 tons of ore per day, the average yield of which is $29.75 per ton. This ore comes from the Sagebrush, and the second, third, fifth and sixth levels.

BEST AND BELCHER.—Owing to the strong flow of water at the face of the north drift, on the 2500 level, work has been discontinued at that point. The water is being allowed to drain off through the drill hole.

CALIFORNIA.—The joint Consolidated Virginia southeast drift on the 2700 level is being advanced at the rate of about 20 ft per week. Are still extracting some ore from the croppings.

CHOLLAR.—The main south drift on the 2000 level has reached a softer character of rock. Good progress is being made. The course of the drift has been turned toward the west.

COLUMBUS DISTRICT.

NORTHERN BELLE.—*True Fissure*, Dec 9: Fair progress is being made in sinking the winze from the fifth shaft level. It is now down a distance of 21 ft and showing 10 inches of sulphurets in the bottom, which give good average assays. The winze from the fourth shaft level to be connected with the extreme end of the fifth shaft level is in much softer ground. A distance of 12 ft has been made in sinking this winze during the week. Its total depth is 40 ft. Work in the crosscut from the third shaft level has been discontinued for the present, but will be resumed as soon as the air connection is completed by means of a winze from the level above. A very promising development has been made on the second intermediate shaft level. It consists of a body of fine ore 2 ft in width, which improves materially as the work progresses. The outlook above the first shaft level is very encouraging, as the body of ore at that point is looking finely and showing no diminution either in quantity or quality. The other shaft levels look about the same as at the time of the last report. The ninth and tenth levels continue their usual yield. Stoping has been commenced on the tenth level in the drift running north from winze No. 1. The stope now shows a total length of 50 ft of ore, of an average width of from 2 to 3 ft. Good headway is being made in the crosscut from the eleventh level, the formation being about the same as last week. There are about 66 tons of ore being extracted and sent to the mill daily. The total shipments of bullion on November account amounted to $81,153.99. A shipment was made on the 7th inst., being the first on December account, and was valued at $10,691.27.

MOUNT DIABLO.—The west drift from winze No. 1 is in 59 ft, and has followed an 18-inch ledge of $60 ore during the week. The face now shows bunches of $65 ore. The north crosscut from the west drift, from the same winze, is 12 ft in length, and is showing favorable ground with sulphurets in the face. Winze No. 2 is down 08 ft. An east drift from the head of this winze shows 8 inches of $50 ore. The west drift has from 8 to 10 inches of $100 ore in the face. An upraise from the west drift from the Gallison winze is yielding a small amount of $60 ore. The winze from the north crosscut in the eastern part of the mine and on the first level is down 18 ft, and shows a few inches of $100 ore in the bottom.

COLUMBUS CON.—The west drift on this first level is making good progress, being in a distance of 70 ft and showing an immense deposit, consisting of slate and ore that assays into the hundreds of dollars. The east drift is in 30 ft, and still in a well-defined ore vein, which is 20 inches in width, and gives assays of a value seldom equaled anywhere in the district. The west drift is in a distance of 20 ft, with a favorable formation carrying streaks and bunches of low-grade ore.

ESMERALDA DISTRICT.

ORE MINES.—*Herald*, Dec. 10: As matters now look it seems very likely that the mines of old Esmeralda district will soon make some smoke, if not considerable fire. The attention of capital is again directed hitherward, and we are informed that it is altogether probable that a strong company will take hold of some good property in the district. That is just exactly what is needed, for it is a well-known fact that outside of the Del Monte there is not a hole in the camp over 430 ft. The Centennial and Cortez mines are down about that distance. Both have good ore in the bottom, and every indication of the pay continuing down. Now what we want is machinery to push these and other good prospects in the camp down to a much greater depth and explore the bowels of our hills. There is no doubt but there are good mines here, but it takes capital to develop a mine, and that we haven't got. The mines that are being worked—the Cortez and Centennial—are looking as well as any in the State for the developments made. Let us have capital and old Esmeralda will step into the front rank, as of yore, as one of the bullion-producing districts of Nevada.

RICH ORE.—The Cortez is yielding some very rich ore from the second level, and a good strike was made in the lowest level Thursday. The sample of ore given us from the second level will no doubt assay several hundred dollars to the ton. The strike in the lower is of much importance, as it demonstrates the fact that there is pay in the ledge at that depth—over 400 ft.

A FEW DAYS MORE.—We expect in the next issue of this paper to herald the fact that the mill at Gregory Flat is in operation and doing good work. Supt. McIntosh informs us that as soon as the pipe arrives and can be laid from the spring to the mill, which will be in a few days, the stamps will be ready to drop.

EUREKA DISTRICT.

A PROMISING PROSPECT MOUNTAIN PROPERTY.—Eureka *Sentinel*, Dec. 6: Mr. Harrington is at work with a few men quietly prospecting the Uncle Sam Con. mine. This property is situated south of New York canyon. It has the appearance of a very good prospect, but in no one place has a greater depth been attained from the surface than in the Sam. Rice shaft, down 105 ft. At this point there are croppings of iron and low-grade ore, from which a well-defined vein has been followed in the shaft clear to the bottom. There are two drifts run off—one at 30 and the other at 60 ft from the surface—both on ore containing 20 per cent. of lead and from $20 to $30 per ton silver. Several years ago a considerable quantity of ore, valued at $140 per ton, was discovered close to the surface at the north end of the claim, which was followed until it was cut off by a dyke of ryolits. The ground surrounding this ore body was found to be loose and very unsafe, so it was decided to abandon the place instead of following the same in depth. Later a tunnel was commenced near by, and this was run along the contact of the ryolite and limestone for about 50 ft, when a turn was made and the tunnel was driven about 100 ft westerly through the ryolite dyke, and 90 ft beyond it into hard limestone. It is intended shortly to commence running a drift between it and the limestone, where there appears to be an excellent prospect for ore.

THE EUREKA TUNNEL.—The output of ore from the Eureka tunnel since December 1st has been at the rate of 10 tons per day. The main shaft is to be made a double compartment one, and Osen. P. E. Conner will go to San Francisco about the middle of the week to purchase a new engine and air compressor to be used on the mine, the appearance at the present time fully justifying the steps ueen.

IDAHO.

ORE.—Wood River *News-Miner*, Dec. 0: The Penobscot folks—Judge V. S. Anderson and Capt. Bledsoe—are doing mostly dead work just now, but keep lowering a few tons of ore every week, which is at once transported to Corning's smelter. Langworthy's men are digging along the Cayuse vein in the granite. Have about 6 inches of splendid ore. We believe the Comstock sale is "off," which was made by Armstrong and Jake Clark to Surveyor McFarland and Jas. Mabee. From the Chicago and Arrow mines Corning is getting considerable good fluxing ore. He has in bins at his smelter 30 or 40 tons from these two mines, and teams are still engaged in hauling. Capt. Lusk will put a crew at work on the Queen Victoria, top of Lookout mountain, about January 1st. His houses and supplies are all ready. Very rich strikes are reported all along the line in the past three weeks, and we have taken pains to know whereof we speak. The Elkhorn, near Ketchum, has always been a good mine, but until very recently its "true inwardness" was not known. It will prove a big feeder to the Philadelphia smelter next season, and they are piling out on the dump tons of ore from a monstrous chimney right now. The Jay Gould strike is one we must look at in a few days. It is said to be much better than has been reported. Whispers concerning the Bullion only are heard, but that the old 30 ft vein is well filled with high-grade ore at a greater depth than ever, we are assured through parties conversant with the workings of the mine. Only a day or two ago the header of the west drift on the 150 level in the Minnie Moore broke into solid galena, with walls and floor of bright shining metal, we are told, of higher grade than that even on the 100 level.

ELKHORN DEVELOPMENTS.—Ketchum *Keystone*, Dec. 6: The Elkhorn ledge was struck on Tuesday, Nov. 28th, in the breast of tunnel No. 2, begun 150 ft east of No. 1 and 70 ft lower perpendicularly, after following the course 70 ft. Since then the work has been extended 15 ft, and from all appearances at the present time a vein is obtained fully equal to that of tunnel No. 1. The object of this tunnel further than developing the ledge is to afford the mine complete drainage, it being 210 ft below a horizontal from surface at shaft, and 100 ft lower than No. 1. The Elkhorn during the past season has contributed to the home market 910 tons of ore, sold at $05,375 81, having made regular shipments from early summer. Immense bodies of ore now lie in sight, and a constant crew of 10 men will be employed through the winter in uncovering ore for spring shipment.

THE DARSHEN CLAIM.—Messrs. J. J. Taylor and John B. Hastings, of this place, have a very encouraging prospect up in the Galena district, called the Dresden, upon which they were forced to abandon work by the heavy snow storm last month. It was their intention to erect a cabin and employ a force all winter in opening the claim, but the early snow interfered.

MONTANA.

MINING EVENTS.—Butte *Miner*, Dec. 6: The most important mining events of the week were the shipment of bullion to the amount of $124,386, the largest weekly shipment in the history of the camp, and the conclusion of negotiations by which the Parrott mining and smelting company assumes control of the Ramsdall, Parrott and Shakspeare properties, which arrangement ensures the continued working of these valuable properties. At the Moulton everything was running smoothly. The mine had been shut down 30 hours on account of leaking boiler flues, but the ore-house being full, the mill was not effected, and has made a steady run. Work in the mines is progressing favorably. Stoping is being done in the west drift of the 100 and 200, where enough ore is uncovered to run the mill for 12 months. At the Alice, Magna Charta and M. C. & V. work was progressing as usual, the ore-houses full and the mills dropping their 80 stamps. At the Belle of Butts a full force is working in the stopes of the 160 and 260 levels and raising plenty of ore. The La Plata is looking well, and work is being energetically pushed on east extension of the 200, where the vein of high grade, noticed in our last report, holds good and widens as the drive progresses. The Lexington is still stoping on the 200 and 300, and producing ore in quantity and quality to satisfy owners of shares, as shown by the bullion shipments published in another column. A force is being worked in the 400 which is drifting on the ledge. The two mills have been dropping their 00 stamps steadily during the past month. At the Anaconda, on account of the large amount of surface work connected with the completion of the new shaft house, setting up new machinery, involving heavy masonry work, etc., the work underground has been somewhat retarded, but the result of explorations has been entirely satisfactory, and when the new hoisting engines are in position an additional force will be put in the mine and work vigorously prosecuted. Pipe has been ordered to connect the air compressor with the lower levels, on arrival of which exploration work will be resumed with the Ingersoll power drills. The new hoist on the St. Lawrence is nearing completion. A new shaft has been started 300 ft south of the vein. Operations just now are principally confined to dead work. The Original Butte has temporarily suspended work, but the pumps are kept in operation, and it is expected that the mine will be worked by a full force in a short time. The Clear Grit is looking better than ever, and is destined to become a first-class copper mine, copper ore of a high grade having been discovered in the west 217.

PONY AND SILVER STAR.—*Herald*, Dec. 3: Mr. R. B. Wallace, who has just returned from a trip to Pony, gives a most encouraging account of mining operations in that vicinity, and expresses the confident belief that the Pony, Silver Star and Iron Rod mines will be found permanent, productive and profitable in the extreme. Henry Elling, of Virginia, owns three very valuable gold properties, one showing 4 ft of $50 ore, another 8 ft of $23 ore, and the third 50 ft of $5 and $6 ore. They are all in process of development, and Mr. Elling is now taking active measures to treat their product. On the Elephant claim, which shows a mass of low-grade ore 50 ft wide, and which, being perfectly free, can be worked with good results. Mr. Elling is now erecting a 20-stamp mill. It is being built of stone, and bids fair to be as permanent as the mine, which seems almost inexhaustible.

The Denver Exposition—No. 17.

[Editorial Correspondence.]

Before proceeding to a description of the mineral exhibits of New Mexico, Arizona, Utah and Nevada, we desire to make just a brief reference to

The Machinery Exhibit.

We commence with that of "The Lane, Bodley Co.," of Cincinnati, Ohio. This exhibit consisted of a 52-inch circular saw-mill, complete, with engine, carriage, head-block, etc.; also an 8x16 friction hoist; also a 40-ton water-jacket furnace, for smelting argentiferous galena ores. The hoister and saw-mill were of the common type, and need no description.

The furnace, however, was of the rectangular pattern, and differs slightly from the furnaces in use here. Wrought iron has been substituted in place of cast iron for the jacket, and in all other places where practicable (a practice that has been in vogue among our California manufacturers for some time). This is the first furnace of its kind made by the firm, and the inventor, Col. Locke, has large claims for it in points of durability and economy. This exhibit was in charge of Mr. Lane, of the firm, assisted by Col. Locke, of Salt Lake.

The Webster, Camp & Lane Machine Company, of Akron, Ohio.

This exhibit consisted of a 12 inch double-hand friction hoist—the most powerful hoist in the building—and the workmanship and design were good. In looking at this machine it reminded me of the California style of work, being heavy in design and evidently intended to do a large amount of work, and do it quickly.

While the brakes were somewhat complicated, it was on the whole a good machine. This exhibit was represented by Mr. Lane, of the firm.

The Denver Foundry and Machine Company.

This exhibit consisted of a 12x24 plain horizontal, slide-valve engine and a 9x10 friction hoist; also the castings for a 10-inch Cornish pump. These were manufactured in Denver, and are quite creditable to the place. The exhibit of this company was fully described in an editorial article some two months since.

Hendrie & Baltoff Manufacturing Company.

This is a Denver firm, one of the largest in the West of its kind. This firm handles work from many of the principle machine houses in the East. Among these exhibits were shown pumps, blowers, ore crushers and engines—in fact, any and everything in the line of mining machinery.

C. E. Kennedy.

This is a house similar to the above. Their exhibit consisted of small hoisters, steam pumps and the Ingersoll rock drill. This drill, with its compressor, was in operation in the annex building. The drill has met with great favor among Western miners.

Lucop & Cook Pulverizer.

This is an English invention, and works upon the centrifugal principle—two rollers revolving upon the inside of a ring and discharging through screens at the side. One of small size, 22-inch diameter, was in almost constant use, and did its work well. But the question asked by all practical men was: "Is it durable?" It is claimed that this machine is running with complete success on many of the gold mines in Australia, and with very little expense in the way of repairs.

South Pueblo Manufacturing Co.

This was quite a large exhibit, and consisted of the Embry concentrator, Thompson's pulverizer, a baby hoist, a Norwalk air compressor, a Bryer drill, and small implements in the line of hardware. The Embry concentrator very closely resembles the Frue vanning machine. In fact, to the superficial observer, the difference is hardly susceptible; but, upon closer inspection, *there is* a difference, but that difference is conspicuous only in the fact that it has merely evaded infringement on the Frue. In some points of mechanical construction it is superior, but in the most important points it is, if anything, inferior. It was in operation most of the time during the continuance of the exhibition, but the sample of its work was not such that any definite opinion could be formed regarding its merits.

Thompson's pulverizer works on the centrifugal principle, by revolving a single ball upon the inside of a steel shoe-ring, supported by rubber buffers. It discharges through screens at the side. The one in operation was a wet crusher, but it is claimed that it will crush dry as well as wet. This machine was in operation only occasionally, and from what we were able to observe, we do not feel warranted in expressing any opinion in regard to the claims made for it.

The Norwalk air compressor, designed to operate the Byron rock drill, was not in operation much, for the reason that only two 5½-inch boilers supplied the steam for the whole exposition, and it was impossible to run all the machinery constantly.

H. H. Scoville, Chicago, Ill.

This exhibit consists of a small donkey friction hoister, an amalgamating pan and a tramway. This tramway is one of the most ingenious things of its kind ever invented. The model was in constant operation under the management of Mr. Huson, the inventor, a thorough mechanic. With this device ore can be carried miles over mountains, down into canyons, turning the sharpest of angles. In fact, it can be run anywhere. The loading and unloading devices are worthy of study. Every precaution has been taken to make this perfect. Coverings for the sheaves over which the ropes runs have been devised in such a manner that as the bucket clutch passes they withdraw, and immediately upon its passage cover the sheave again, making it impossible for the rope to get off the sheave. This was pronounced by practical men and those acquainted with tramways to be superior to anything of its kind ever invented.

The Rand Drill Co.

Had an exhibition in the annex building, consisting of a 10 inch duplex air compressor. This, with its drills, was in almost constant operation, under the management of L. W. Aldrich. As far as could be judged by the work done on exhibition, the drills seems to be first-class. There was no real test among the air compressors in regard to economy, but from the general working of all, the Rand does its work as economically as any in the building. These drills and compressors are extensively used in the copper mines of the north and iron mines of the south.

Pumps.

There was quite a large display of steam pumps—Worthingtons, Knowles, Blakes, Davideons, Camerons, Hookers, Deanes, pulsometers and injectors. As no tests were made in regard to their relative merits, it is impossible to say much about them.

Colorado Coal and Iron Co.

This was one of the most interesting exhibits in machinery hall. There was to be seen iron in all stages of reduction, from the crude iron to the steel rail; iron of all sizes, shapes and quality known to the general trade. This company have rolling mills in both Denver and South Pueblo. Within the space occupied by these were to be seen some of the finest specimens of Colorado coal, one piece being a solid cube 8x4 feet square, weighing nearly 4 tons. Some of this coal cokes well, as the specimens showed, but it lacks weight when compared with the English.

Looking at this exhibit reminded outside manufacturers that before a great while their assistance will not be needed in the opening up of Colorado's resources. We shall give an extended notice of the works of this company, both at Denver and Pueblo, in a future letter.

There were many other minor machines that might be described, but their description would not interest the generality of our readers.

It is to be regretted that after so many different manufacturers had gone to great expense in taking their exhibits to Denver no competitive trials were entered into.

So many different machines destined to accomplish the same ends, and all claiming superiority over each other, is absurd, and rendered this branch of the Exposition comparatively worthless, so far as meritorious machinery was concerned. To convince a practical mining man of the superiority of any machine requires a practical demonstration. The thorough mining or mill man is very loath to try experiments, and he will turn away from a machine that may be capable of doing good work simply because its merits have not been proved by actual test.

It is to be hoped that at the next National Mining Exposition this matter will be taken into consideration, to the end that we may be able to determine which is the best machinery for certain processes and to do away with local and individual experiments. Such a system of competitive experiments would tend largely to make mining a legitimate business.

In concluding this report on the machinery, the writer desires to express his thanks to the enterprising firm of Rankin, Brayton & Co., of the Pacific Iron Works, of this city, for valuable assistance and information rendered him by their courteous and energetic representative, Willis G. Dodd.

We are informed of a number of sales of mines pending in this district, several in Mineral Hill district and some at Mineral Creek, but none of them are absolutely closed at last account. A considerable number of mining experts have visited the various camps lately and are now in the field. Some of them have been here before, and after running round the universe, have come back to give us their last sober thought, admitting the superiority of our mines. If some enterprising *mill man* would put up reduction works so that our miners could realize money from their dumps, and thus be enabled to make further developments, our district would show results that would astonish the country and the reduction man himself would soon pulp a round million. It is astonishing to us that men of means and enterprise will not open their eyes to the immense chances there are in Pioneer District. If they will establish suitable reduction works and deal fairly by our miners, we will guarantee 500 tons a day to anybody who will open a chance for our miners to supply the ore at paying figures. The ore is abundant and of every variety. *Pinal Drill.*

Broke Down.—The Carter-Bancroft mill broke down last Friday, and it will require several weeks before it can be started up again. The difficulty is with the cylinders in which the ore is roasted, which, on account of being imperfectly constructed, have sagged so that the stirrers cannot revolve. Col. Carter started on Saturday for Philadelphia to arrange for the construction of new cylinders that will stand the heat of the furnace.—*Georgetown (Col.) Courier.*

A Prospector in Montana.

From a letter in the Helena *Independent* we take the following items, gathered on a prospecting trip just completed:

We started from the "end of the track" in Missoula county last spring, proceeded up Bull river, and found some very fair prospects of quartz and copper ores between Clarke's fork and the Flathead, but not sufficient to detain us. We spent a few days at the Hot Springs, to give one of the party the benefit of the waters for a rheumatic leg. Several half-breeds are located near these springs, but no one seems to have sufficient energy to put up a building and induce tourists and health seekers to come there. About the healing virtues of the water there is no question. They have been resorted to by the Flathead, Kootenai and Pen d'Oreille Indians from time immemorial for rheumatic affections. At present camping there is made peculiarly dangerous by the multitude of rattlesnakes which seem to make these springs their winter quarters.

Passing northward along the lake up the valley and following the old Kootenai trail, we met with no excitement beyond what is experienced by every prospector. Occasionally our mules strayed off for pasture new, leaving us temporarily afoot; but we had no serious inconveniences, thanks to the kindness of the Indians, who were invariably free with information and sometimes with help. I can only ascribe poor Lo's kindness to the good teaching of the Fathers at St. Ignatius Mission—certainly our treatment at their hands was a great contrast to what is usually experienced in Choteau county from the Crees and Blackfeet. As I was only a greenhorn, so far as mining was concerned—almost a tenderfoot, I may say—I cannot give much information respecting the country we traversed with regard to minerals. But I wish to place on record, right here, that the next gold excitement is going to be over the line. We traversed the country lying between the Kicking Horse, Yellowhead and St. Mary's passes, and I can say, without danger of injuring our party's future plans, that there is bound to be a booming camp in that region. No doubt this will meet the eye of some old camper who has trodden those divides and panned for color in the numberless and nameless creeks, and such only can realize what a rugged, grand, uninhabited region lies open to the adventurer. The Canadian Pacific will doubtless cross by one of these passes, and probably run down a narrow-guage to the camp.

If any of your capitalists are open to take a hint, I give this for what it is worth: Between the headwaters of Swathouse creek and the Jocko river and all around the Talbot lakes (on the reservation, mind), there is every indication of hematite iron ore, which in this section would outbid any quartz now being worked. It is within reasonable distance of rail and (incidentally) surrounded by some of the finest red pine in the country. It is surprising to me that some of your Missoula county readers have not petitioned our Delegate in Congress to use his influence to remove the Flathead reservation from its present limits, making the southern boundary run where the northern limit now lies, that is, about the center of the lake, and let it extend northward to the British line. This would throw open two of the finest farming tracts in the country—the Jocko and Mission valleys—as well as an extensive stretch of hills favorable to the prospector, where colors can be found on several creeks. The Indians would be removed from contact with the highways of travel, and, I fancy, would not be aware of the change.

The Las Vegas *Gazette* says: "On Saturday afternoon a great discovery was made in the Organs which looks as though it will exceed in richness Lake valley. The lucky strike was made in the Copper Duke mine, about 30 miles from Las Cruces, and consists of pure gold in lumps mixed throughout the ore. The ore, besides the gold, runs heavy in copper and silver. They report the vein all alike, and the specimens brought to town are full of pure gold, and will undoubtedly run from $25,000 per ton. I saw a lump about as large as my fist. It was a curiosity to look at it. They report 600 or 700 people on the ground already, and the excitement runs high here over the discovery."

The Santa Fe *Trail* says: "There is no better opening in New Mexico for a safe and permanent mining investment than in the gold veins about Hillsboro. With all deference to the splendid show now made in Lake valley, these strong sulphuret gold-bearing veins will be standard-producing mines when Lake valley will be a story of the past. The Percha river heads in the Black Range, about 15 miles west of Hillsboro, with several branches, and remarkably rich discoveries of mineral have been found there. It is now the prospector's El Dorado, and attracting more attention than any other locality in New Mexico."

Cornucopia.—The *Times Review* says this district, now deserted and containing but two or three inhabitants, is still regarded by many as having merits that will sooner or later be developed. The three mines on which machinery has been in operation—the Leopard, Hussey and Panther—have produced a large amount of bullion, the Leopard alone having shipped over a million and a half. The Hussey, Panther and Constitution have been relocated, and the assessments are promptly kept up.

Calcining Limestone and Roasting Ores.

An improvement in calcining limestone and roasting ores, and in kilns for such purposes, has recently been proposed by Mr. Stephen Collier, of Bridgend, England. The method hitherto almost invariably adopted is to mix certain proportions of limestone and fuel in a kiln and to allow burning to take place till the calcination is complete. This is not only an uncertain but a wasteful method, and as the combustion cannot be regulated, the result is naturally irregular. In some cases the lime is over-burnt and at other times insufficiently burnt, either of which is a source of loss to the producer. The object of Mr. Collier's invention is to burn lime and to roast ores in such a way as to effect a saving of fuel and to turn out a uniform product.

The kiln employed is completely arched over its entire area with specially shaped bricks of fire-clay, each of which is provided with a small aperture to permit the passage of air and piping. Over this arch, and separated from the lower one by a layer of fire-clay or sand, another arch of ordinary fire-brick is built, and the top leveled with fire-brick. The apertures before mentioned pass through from bottom to top, and the level surface formed in the manner indicated constitutes the floor of the kiln. The center of the floor is provided with a hole about 15 inches in diameter, and four other holes, each about 12 inches in diameter. These are what are known as the "draw holes," and the fuel and limestone are prevented from falling through by means of fire-bars underneath.

Under the arch, and about five feet below it, is the floor on which the man stand to take the lime from the draw-holes and pass it through a doorway in the side of the chamber. This doorway should, of course, be closed during combustion. Immediately under the brick arch are annular rings of gas piping connected with a supply pipe, and vertical pipes are inserted into the small holes in the arch of the kiln at frequent intervals. These pipes convey the igniting agent, either gas or oil, or any other cheap inflammable gas, such as the "Dowson Economic Gas," to the upper chamber.

The method of operation is as follows: The gas or oil jets being all in their places and ignited with the smallest possible flame, a thin layer of bituminous coal is distributed over the floor of the kiln, then a layer of limestone, with the usual sprinkling of coal. The kiln is loaded with its full charge and supplied with fuel necessary to maintain rapid and continued combustion, so as to keep the stone at a red heat, in which state the carbonic acid gas escapes. When all this is ready the gas is fully turned on, and the aperture through which the draft enters from below is enlarged gradually, so as to heat the stones slowly. Later on the full blast is put on, and afterward the whole mess will be an immense body of fire. The fire may be regulated with the greatest nicety; if too strong in one part of the kiln, the gas may be lowered there and the supply of oxygen cut off by the insertion of stoppers in the air-holes contiguous to the strong fire, and *vice versa* if the fire is seen to get weak.

When calcination is complete—that is, when all the carbonic acid is driven out of the stone—the gas is turned off, the admission of air prevented, and combustion ceases. Then the air holes and draw holes are fully opened and cooling proceeds till the lime is fit to be removed. During the charging of the kiln a steam jet is turned on under the arch, and continued more or less during calcination. Its effect is that the quantity of coal required is much less when the stones are moistened. A floor (of iron) left above the kiln is utilized to dry bricks preparatory to burning. Above this is a roof with stack to assist draft and carry away waste products. The high kiln answers the purpose of a chimney, but where this may not be suitable or applicable, a stack must be built, or what is equally efficacious, a small fan will create sufficient draft to insure rapid combustion.

The advantages claimed for the method are absolute certainty in the process and greater economy of coal than in the present practice. Every change is a complete and separate operation, and can be regulated with precision. According to the method now pursued, a kiln must be kept in operation continually, so as to prevent the fire from going out, thus entailing a considerable waste of fuel. In every district the demand for lime is more or less irregular; it varies often from 10 to 200 tons per week, and the lime burner is obliged to keep a kiln of the latter capacity going for weeks to supply the smaller quantity. With the improved kiln and method all this is altered; no more need be produced than the requirement of the moment demands. It is claimed that the quality of the lime will be much improved, as the operation of calcination will be under complete control, and that it will come from the kiln in large lumps, with a small percentage of smaller or dust lime.

New Fields for Next Summer.—There are already to be seen indications of the boom which is bound to occur in the region down about Benton and beyond next summer, when the Carson and Colorado Railroad will be running into that region. Nearly every week we hear of mining properties changing hands in that region. Buyers who have shrewdly calculated all the advantages that are liable to accrue are going in advance of the railroad to make their purchases.—*Virginia Enterprise.*

Mining Sharks.

The *Foothill Tidings* says: Our mining reporter is particularly pleased at the aspect which the mining business is beginning to assume. We have interviewed many prominent men in mining circles, and they all regard the outlook at present as much better than it has been for years. Yet it is not near what its merits would justify. Grass Valley suffers more or less, as do all mining communities, from what is known as the "mining shark." We are not entirely certain but what Grass Valley has a few "sharks" to spare; at least there is considerable complaint about them. The "shark" generally owns, or has the sale of some mining ground, and he makes it his business to hang around the public places and keeps track of all that is going on in the mining line. The man from the East, or a stranger, looking at mines is generally his victim. The shark "saddles" himself upon that stranger, and he volunteers information concerning any and all mines, making it a point to discourage any investment in any mine save his particular property. The "shark" is to the mines in this district what "The Old Man of the Sea" was to "Sindbad, the Sailor"—he just gets astraddle of the mine's neck and rides it to death. When he strikes an Eastern man or stranger who has never before encountered him, he sends him away with the impression that mining is all a humbug, and the men who operate in mines are bigger humbugs than the mines themselves. The "shark" is becoming well known, thanks to newspapers, and before long he will be a thing of the past.

The above thoughts suggested themselves by a conversation which we had several days ago with a gentleman who came from the East and stopped here in Grass Valley, intending to invest, if possible, in some mining property; but as soon as he made his business known the "shark" took hold of him, and the gentleman left town with the impression that there never was or never will be but one paying mine in this district, and that one is something that the "shark" owns, and which "in '50 or '67 paid $85 per ton."

Characteristics of a Lava Stream.

The surface of fluid and semi-fluid lavas is covered with vast quantities of froth or foam which has been generated by the action of the escaping steam. If the lava consists of a mass of crystals floating in a liquid magma, this froth cools into the rough, cindery-looking material which is called scoria. If the lava is glassy it becomes pumice, a mass of minute glass bubbles drawn out in one direction by the movement of the mass while it was still in a plastic state. Fragments of scoria and pumice are often thrown by a violent escape of steam to a height of hundreds or thousands of feet into the atmosphere. While going up and coming down they encounter each other and wear each other away by their frequent rubbing, with a noise which is one of the most noteworthy accompaniments of volcanic eruptions. Mr. Ponlett Scrope, who watched the Vesuvian eruption of 1822 for nearly a month, remarks that at first fragments of enormous size were thrown out, but they were gradually reduced by constant re-ejections, till at last only the most impalpable dust issued from the vent—a dust that was so exclusively finely divided that it went everywhere, even into the most closely-fastened boxes. Mr. Whymper estimates that no less than 2,000,000 tons of dust must have been ejected during a single slight outburst of Cotopaxi, which he witnessed, and Prof. Bonney calculates, from actual examination, that it would take from 4,000 to 25,000 particles of this same dust to make up a grain in weight. The temperature and consistency of lava streams vary greatly, and the variations give rise to differences in the appearance of the cooled mass. The surface of the stream cools rapidly in the air, so that it appears dull red at night and black by day—like a great mass of rough cinders—while all is of a white heat beneath, and may be seen at night shining through the rough, cindery masses. Some streams are very liquid, resembling rivers, and filling every channel in their course, while others, cooler and stiffer, might be more fitly compared to glaciers, creeping along so slowly that the fact of their movement can be established only by the most careful observation. The stiff lavas leave a crust wrinkled and folded like coils of rope, and are then frequently called "ropy lavas." The very liquid, fast-flowing lavas leave a surface covered with rough, cindery masses, presenting jagged projections.—*Popular Science Monthly.*

The Spenceville Copper Mines.—The Marysville *Advocate* has the following item regarding the copper mining district in the lower part of Nevada county: The Copper Mining Company at Spenceville owns about 40 acres of copper-bearing ground and several hundred acres of adjoining timber land. The hoisting works, mills, roasting sheds and leaching vats cover several acres. The mine yields an average of 42 tons of ore per month, 80 per cent. of which is copper cement. It is now established as a permanent industry, and pays regular monthly dividends. The company employs about 25 white men and 40 Chinamen. There are several other copper mining claims in the vicinity of Spenceville, which have been patented and will probably be worked before long.

Useful Information.

Wire Cloth.

Wire cloth, such as is used by paper mills and for sieves, corn-poppers, and hundreds of other purposes, is woven in the same manner as cotton or woolen goods, save that a large portion of the work is done on hand looms. Wire cloth for window screens, requiring less care in its manufacture, is woven on power looms, and a single concern at Clinton, Mass., makes 15,000,000 square feet of this cloth per annum. The total amount of wire cloth woven by machinery for window-screens alone in the United States is put down at 30,000,000 square feet per annum. For this purpose light and cheap iron wire is used.

For paper mills cloth made of fine and strong brass wire is employed. There is no other process for making paper except by running the pulp over brass wire cloth, and this cloth has to be renewed every few months. A single firm of paper manufacturers in New York is put to an annual expenditure of $2,000 to replenish the wire cloth in its mills. As there are about 950 paper mills in the United States, it will be seen that the quantity of wire cloth required by them all is considerable.

Wire cloth, says the *Commercial Bulletin*, is sold by the square foot, and is graded according to the number of wires in an inch. Cloth which contains two meshes per linear inch or four per square inch, is designated as No. 2. That which contains 100 meshes per linear inch, or 10,000 per square inch, is designated as No. 100. Cloth as fine as No. 120 is sometimes made, but it is always of brass or copper. No iron wire is used in any numbers above 40. The wire cloth used in window screens is No. 13, and that employed in flour sieves is principally No. 20. The brass cloth used by paper mills is mostly No. 60. The price of No. 2 iron wire cloth is 10 cents per square foot; that of No. 2 brass is 40 cents, and No. 2 copper is 45 cents. No. 100 brass cloth sells at $1.25 in small lots at retail, and at about $1 in large lots at wholesale. These prices will serve as fair examples of the value of wire cloth in general.

The Burning Cinder Bank at Trenton

A singular phenomenon has been visible at the works of the New Jersey Steel and Iron Company for several days past. The made ground along the river is smoking like a volcano. The circumstance attracted special notice a few weeks since, when a workman observed that not only was smoke ascending, but even a mass of fire had formed along the bank in several places. For years the company has been accustomed to dump the furnace refuse, ashes and cinders down into the river along their works. The dumping has accumulated so much that fully six acres of new ground have been made where the river held domain a few years ago. The made ground was considered thoroughly safe, and buildings have been erected on it.

How to check it is a question that puzzles everybody. Water poured upon the ground is of no avail, for the smoldering flame is too deep-seated for that. The only recourse seems to be in digging trenches through the whole length and breadth of the place, and filling these with water. At least an acre of the made ground is on fire along the whole length of the bank. Volumes of smoke roll up, and beneath the feet in certain places can be heard the peculiar cracking sound as if of flames endeavoring to break up through the ground. The made ground is 24 feet deep, and an iron bar which was driven down half that distance was red-hot when drawn out again shortly afterward. Whenever the men began to dig a trench the smoke at once made its appearance. The workmen could not stand in the trenches at times, owing to the heat and stifling smoke. The cinders and ashes from which the smoke ascends have been lying there for a year. People who live on the island opposite say they noticed the smoke six months ago. At night the fire can be seen better. Long patches of the bank are then seen ablaze, and the smoke rolls up in great clouds. There was a similar fire at the mills years ago, but it was not so extensive as the present one.

Stopping Machinery by Electricity.—An ingenious method of instantly stopping machinery when in motion is said to be in operation at the Dominion bolt works, Toronto, Canada. A wire rope coiled around the stem of the throttle valve of the engine carries a weight, which is held in place by a rest, and the whole arrangement is so placed that the passing of an electric current along a wire releases this rest and causes the weight to fall. The tension thus thrown upon the wire rope acts upon the throttle valve, cuts off the supply of steam and consequently stops the machinery. Buttons with wire connections are placed in different parts of the works, and on pressing any one of these the passage of an electric current acts as above mentioned. In any factory these buttons can be placed in every room, or several of them in a large room, as may be required. Should anyone happen to get caught by the machinery, the simple pressing of a button in the most distant part of the factory will stop the whole as quickly as could be done were the engineer standing ready to instantly obey a given signal.

How Flies Climb.—Herr H. Dewitz has communicated to the Berlin Society of Natural History some facts that bear very strongly against the generally received theory that flies adhere to perpendicular walls and ceilings by virtue of some sucking power in their feet. He asserts that the feet of flies cannot possess the sucking property ascribed to them, for they are hard and destitute of muscles. The theory has long been contradicted by the experiments of Blackwall, who found that flies could climb the sides of a jar under the receiver of an air pump where there was no atmospheric pressure, and who asserted that the power of adherence was due to a sticky matter secreted from the foot-hairs of flies. This assertion was generally regarded as not proved, and the case has rested there. Dewitz reports that his investigations have shown that Blackwall was right. He has watched the exudation of the sticky matter from the feet of the flies by fastening one of the insects to the under side of a plate of glass and viewing it under the microscope. A perfectly clear liquid was seen to flow from the ends of the foot-haire and attach the foot to the glass. When the foot was lifted up, to be put down in another place, the drops of the sticky matter were perceived to be left on the glass, in the exact places where the foot-hairs had rested. The adhesive fluid appears to pass down through the hollow of the hair, and to be derived from glands which Leydig discovered in the folds of the foot in 1850. A similar adhesive matter appears to be possessed by bugs, by many larvæ, and probably by all insects that climb the stems and the under sides of the leaves of plants.

To Keep Silver-Plated Articles Bright.—This can be done by dipping the articles occasionally in a solution of hypophosphite of soda. Large articles, like pitchers and salvers, should be wiped off with a rag dipped in the solution and dried with a soft towel. By rubbing a little with a piece of chamois leather they will be as bright as new.

Solidified Tea.—One hundred grms. of ground sugar and 10 grms. starch sugar are boiled with the quantity of water required for solution, until the mass becomes tenacious, but yet remains transparent. After cooling, 50 grms. of tea previously mixed with 50 grms. of dry sugar, are added. The plastic mass is pressed into moulds, and when solidified forms the preserved tea.

Good Health.

Home Treatment of Croup.

[Written for the Press by Mrs. Lucy McCann.]

In a late paper we find a notice of a suit for $10,000 damages, brought by a father whose child had died of croup, against the doctor who attended it. This seems to us absurd, for we hold that when any parties assume the responsibilities of parentage there is implied a duty on their part to prepare themselves with the knowledge requisite for the protection of their children from the dangers to which they are liable to be exposed. Especially is this necessary in regard to the treatment of croup and its kindred diseases, which are so sudden in their attack, so swift in running their course, and, if neglected, so fatal in their termination. There can be no excuse for ignorance upon such subjects in these days of common sense, medical works, "Household Physician," etc.—particularly in regard to croup, in which delay is so emphatically dangerous.

This disease, taken in time, or as the doctors call it, "in the first stage," is a simple, easily-managed affair. If neglected from ignorance, want of care, or waiting till the doctor comes, the "second stage" quickly follows—wherein the skill of the best physician is often of no avail to save the life of the poor little sufferer, for whose death those having charge of the child are responsible, and not the doctor called in too late to save it. The season when children are most subject to croup is at hand, and we feel that a few hints regarding its home treatment may not be out of place at this time.

It is many years ago since we were first awakened at midnight by the shrill, harking cough of a baby with the croup. At that time we knew only enough of this disease to know that it was one which admitted of no delay in its treatment, and sent instantly for the doctor, who happened, luckily for us, to live near by, and came at once to the child's relief. We watched his every action with intense anxiety whilst he kindly explained to us the nature of the disease and the reasons for the remedies he applied.

Taking a narrow strip of flannel and dipping it into a mixture of sweet oil and ammonia, he put this around the child's throat to act as a counter-irritant and draw the blood from the seat of the disease (in the windpipe) to the surface. He left this cloth on until the little one's neck was quite red, warning us at the same time never to blister the throat externally, as that was not the object, but simply to redden it, when, if it caused the child much pain, a cloth dipped in the plain oil could be put on instead, which would relieve the burning sensation. The doctor then administered small doses of syrup of squills, from time to time, to soothe the irritation in the throat and relax the system, and under his care the little patient was sleeping quietly in an hour's time, with only a slight hoarseness left next day to tell of the danger through which it had passed. The fact, however, that it had had the croup and might be subject to it, alarmed us greatly, and we thought, with dismay, "Suppose we had lived five miles in the country with a 10-mile ride between us and a doctor? The child might have died before help could have been brought, and we, in our ignorance of what to do for it, would have been to blame for its death." We concluded to turn doctor ourselves, to that degree that we did not mean to rest until we knew all that a layman might concerning this dreaded disease, or at least enough to act intelligently for the child's benefit until the aid of a physician could be procured.

Our first study was old "Dewess on Children's Diseases," and other and later medical authorities followed after, until the cure of croup was reduced in our minds to the simple propositions of taking "time by the forelock," understanding the nature of the remedies to be used, and applying them instantly, thereby at once checking the progress of the disease, nor ever letting it pass into that dangerous "second stage," for which so little can be done, wherein the windpipe or trachea becomes filled with a tenacious phlegm or "false membrane," which prevents the child's breathing, and, in a short time, chokes it to death. We learned, then, that the first step in the cure of croup was to check by counter-irritation or reddening the throat externally the rush of blood to the diseased part. This may be done with many things, and it is well to know them, as the *effect* is what is desired, and it matters little what agent is used, so that this end is accomplished. Let us suppose a case.

In a lonely farmhouse, miles away from doctors or even neighbors, a child is taken at midnight with the croup. "What shall be done?" cries the young mother in dismay. Put a counter-irritatant around its throat at once. "Of what?" Sweet oil and turpentine, mixed together in about equal parts. "We have neither in the house." Some melted lard then, with a little ammonia in it (not enough to blister, mind you). "Dear me, we are just out of both!" Quick, then, we are losing time. Get some coal oil from the lamp can. Put some in a saucer, dip your flannel in it, and pin it around the child's neck, or a weak mustard plaster, or red pepper sprinkled on a strip with melted lard—in fact anything which will produce the required effect, if you have not the turpentine, which the experience of many years has proved to us to be the best thing, for two reasons: First, because children usually dislike the strong smell of ammonia, mustard, etc., so much that they rebel at their application, and secondly, turpentine has, besides its rubefacient powers, a strong anesthetic effect, quieting the nerves and putting the little patient into a gentle sleep.

"The child's breathing is still very hard," cries the mother. Give it 15 drops of squills. "Haven't a drop left." Give syrup, then. "We never keep that." No matter! Drop four or five drops of coal oil on this teaspoonful of sugar and give that to the child. It cuts the phlegm some way, and usually acts like a charm; or five drops turpentine will answer the same purpose. There! Keep the little one well covered, and he'll be all right by to-morrow. Don't let him out of the house for a day or two though, or he may take fresh cold and have a relapse, when you will have your first work to do over.

For the first stage, *in which croup should always be treated*, one hardly needs a doctor at all, as the remedies are such everyday affairs that they may be found in nearly every household, and the reasons of their use are so obvious as to be easily remembered, whilst the relief given is, in 9 cases out of 10, so instantaneous that the patient requires no further medication. In every case, in our experience, the *first croupy cough* has been to us the signal for immediate action. Our bottles of sweet oil and turpentine are always on hand ready for use, and we mix them together according to the age of the child and the tenderness of its skin—using only a few drops of turpentine in the oil for the baby's neck—whilst as a remedy for sore throats for grown people the turpentine may be used nearly pure, and sometimes without any oil at all. So efficacious have we found this external application, *if used at once*, that the patient rarely requires anything more than this, which we often apply to the little ones by taking them in our laps before the fire and rubbing the mixture well in around their throats and chests, putting a "cravat" of flannel on afterwards to prevent any cold and keep the throat warm. This flannel we keep on the throat for several days, finding it assists greatly in preventing any relapse on the part of our patient.

The recovery of the $10,000 damages alluded to above cannot restore to that father his child—lost through the doctor's delay or his own ignorance, as the courts may decide—but the knowledge of the few simple remedies herein suggested (which have stood the test of many years' practice in the treatment of croup), may *save* the life of some little one, and deprive that scourge of childhood of most of its terrors in many a home. With this hope we send them forth, believing that where these remedies are promptly and properly applied this disease is no more to be dreaded in the household than an ordinary bad cold, into which it immediately merges as soon as its alarming symptoms have been checked by proper treatment.

SAN FRANCISCO:

Saturday Morning, Dec. 16, 1882

TABLE OF CONTENTS.

EDITORIALS — Dodge's Ore Pulverizer; Smelting Ores of Gold and Silver, 385. The Denver Exposition—No. 17, 390 Passing Events; The City and the Mines; Another Debris Suit; An Explosion of Railway Appliances, 392. The Judson Manufacturing Company—A Nursery of Pioneer Industries; The Siphon, 393. Patents and Inventions; Notices of Recent Patents, 396.

ILLUSTRATIONS. — Dodge's Ore Pulverizer and Granulator, 385. Diagram Illustrating Principle of the Siphon, 393.

MECHANICAL PROGRESS. — Manufacture of Iron and Steel Direct from the Ore; The Inventor of Malleable Iron; Glass Shingles; Tempering by Compression; Wooden Bolts in House Building, 387.

SCIENTIFIC PROGRESS.—Atoms; The Cause of Life; The Four Forces in Nature; Earth Currents and Telephones; Ice, 387.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Assessments, Meetings and Dividends, 388.

NEWS IN BRIEF, on page 388 and other pages.

MINING SUMMARY from the various counties of California, Nevada, Idaho, and Montana 388-89.

USEFUL INFORMATION. — Wire Cloth; The Burning Cinder Bank at Trenton; Stopping Machinery by Electricity; How Flies Climb; To Keep Silver-Plated Articles Bright; Solidified Tea, 391.

GOOD HEALTH.—Home Treatment of Croup, 391.

MISCELLANEOUS. — The Paradise Mines; Prosperity of Salt Lake City; A Body of Mica; A Miner's Wonderful Nerve; Montana; Silver Interests of Globe; Mines and Works in Arizona; A Promising Region, 386. A Prospector in Montana; Calcining Limestone and Roasting Ores, 390. Mining Sharks; Characteristics of a Lava Stream, 391.

CORRESPONDENCE —Early History of the Comstock, 392. Notes from Eureka, Nevada, 396.

Business Announcements.

Metallurgist—Ottokar Hofman, St. Louis, Mo.
Gold Mine for Sale—C. D. J., San Francisco, Cal.
Dividend Notice—Northern Belle Mill & Mining Co.

Passing Events.

Affeirs down in Bodie seem to he in a had state. The recent attachment suite hy Wells, Fargo & Co. against the Red Cloud Con., Noonday and North Noonday has dealt a ssvere hlow to Bodie. The subsequent action of the three companies in levying such large assessments—Red Cloud $2, and the two Noondays $1 each—hes hed a further tendency to bring the action of Wells, Fargo & Co. into prominence. The Standard and Bodie, the two principal mines of the camp, appear to he the only proeperooe onee.

Another "debrie euit" is on trial in this city. We refer to it elsewhere.

It ie stated that a strata of ore 1,600 ft. helow the eurface in the Eberhardt and Aurora tunnel, at White Pine, has been made. The ore aesaye over $100. Thie will he good newe to mine owners in that dietrict.

Feare are beginning to he entertained that we will have a dry winter, very little rain having fallen eince the early showers.

The introduction of water power at the Idaho and other minee of Grase Valley marks an era in the hietory of thet proeperoue mining region of California.

THE Northern Paoific R. R. Co. having secured nearly all the right of way over the surveyed route, are baginning preparations to huild the line from Portland to Kalama. This will connect the entire syetem of railwaye in Oregon and Washington Territory with Puget Sound. The transfer across the Columbia will be made by a large iron ferryhoat, capable of holding 20 care, whioh ie now in course of conetruotion in New York. It will be eent here hy rail in detached eections. Work next summer will be delayed hy high water, but it ie expected the link will be done November Ist, next year.

The City and the Mines.

Mining is not at all adventnre, nor is adventure judioiously planned an altogether forhidden thing in the counting-honse or evsn in the hanker's closet. Very close calculations can be made in mining enterprises on quite slight and inexpeneive trials, where experience and calm judgment are allowed to control. The miners of this coast have now acquired a dsgree of experience which, if rightly applied, enables them to carry on their work intelligently, and, where integrity prevails, there is little risk of loss. Capital ought easily be secured where good evidenoe can he given that it will he judiciously expended and honestly guarded. Let honesty, patience and perseverance he directed by indomitahle Anglo-Saxon will, and we may remove mountaine and nncover wealth which will make the name of California blaze again.

The mountains look to the city for capitel, and the city looks to the mountains for the profit on that capital. If the capital is withheld, there ie no profit for either party. The benefits which have resulted hy investment in legitimate mining operations ought to be incentive enough to our oity capitaliste to indnce them to invest etill further. If they will turn their attention nearer home, moreover, they will hsnefit their own State as well as our neighbore.

Most of the very elegant and attractive buildings now being erected in San Francisco are heing put up by mining oapitalists with money made from mining ventnres. That fact alone showe the benefits the mines directly confer on this city. Yet there are many here who decry mining ventnree on all occesions, perhaps because they themselves have been unlucky. Still, as long as there are mines to work there will he found men to work them and oapitalists to invest in them, and those who do not take the risk should not begrudge the profits made hy those who make the venture.

The mineral field which looks to this city for its eupplies is vast and constantly increasing in importence. The building of railroads has been an important factor in this progress, but their presence may not redound to our good unless our people take some speciel interest in the mines themselves. Of late we have seen mining propsrties of great value slide out of onr hands into those of people at a distance, and the profits will, of course, go in the same direction.

The truth is, we in San Francisco have erroneously laid to mining many disastrous feilures which have been only stock schemes, and never were anything else. We have heard of people failing, of men becoming defaulters, of respectable people committing crimes, or robberies, and of people being ruined, and have heard that these thinge were hronght abont hy mining trensactions. They may have been brought about by speculation in mining stocks, and no donbt have been, but these persons generally were not mining men by any means. The stocks might have represented grain, railroads, gas, water, or anything else, so far as the speculators were concerned. They did not go into mining at all. They honght stocke to speculate and make money without work. Lots of people did this, and lots more will continue to do it.

But it is unfair to lay to the mining industry the failnre of this clase of persons. The men in San Francisco and Oekland who have invested in legtimate mining enterprise, as a businese proposition, aside from speculation, have generally done well. Of course, if people undertake large operations in any line of business without knowing anything about said business, they are not apt to record any very hrilliant success. Yet there are hundreds of men with slight knowledge of mining matters who have made money out of mines. The citizsns of San Francisco, instead of turning a cold shoulder to minee and minere, should encourage them in every way.

Another Debris Suit.

Another debris snit is on trial before Judge Sawyer, of the U. S. Circuit Court, in this city. It is the case of Edward Woodruff vs. The North Bloomfield Gravel Mining Co. et al. Mr. Woodruff, who ie a resident of New York, hut a large owner of property in and near Maryeville, petitione for a temporary injunction to isene againet the defendants, enjoining the depoeiting of mining dehrie in the Yuba and Feather rivere. The manner in which the oase ie brought, and the oourt in whioh it ie to he decided, makes thie, in the eetimate of the anti-dehrie men, the moet important phase of the noted question ever preeented in oonrt.

The importance of the case is suggeeted hy the legal and hueineee repreeentative of the two eidee in attendance. The plaintiff is repreeented, legally, by Judge Cadwalader, of Secramento, Judge Belcher, of Marysville, and Profeesor Pomeroy, of San Francisco. The farmere are aleo repreeented hy George Ohleyer, President of the Sacramento Valley Anti-Dehrie Association, hy ex-Mayor Bingham, of Maryeville, and a numher of other prominent Maryeville and valley men. The defendants are represented hy S. M. Wileon, Judge Wallace, I. S. Belcher and J. Byrne, counsel, and J. Hamilton Smith, President of the Gravel Miners' Aesociation, Mr. W. A. Skidmore, Secretary of the Association, Supt. J. O'Brien, of Smartsville, and many other miniog men have been present in court. A large number of affidavits have been filed. A large portion of the time eo far hae been taken up in deecrihiog the regulations and customs of the miners.

An Exposition of Railway Appliances.

Instead of having general expositions which combine all the varied features with whioh we are so familiar, the tendency at present is to have exhibitions representing one industry alone. The idea is that the general expositions cannot give the attention to the more prominent industries that they deserve, and that they are therefore but poorly represented. With people directly interested in one branch of industry and with all the proper facilities for illustratiug thie branch in all its points of view, an exhibition can be arranged which is satisfactory in every respect.

In Europe, lately, they have had expoeitions of electrical appliances, of household implements and ntensile, of ship and boat building, of agricultural implements, of the fishing intsrests, etc., and here we have had a cotton exposition and a mining exposition. All these have been successful from a pecuniary point of view, and, what is more to the purpoee, in disseminating information on the special subject, not only to the general public, hut to the persons directly interested in the indnstry itself.

About a year ago the feasibility of organizing and conducting a National Exposition of Railway Applianoes, at some favorable point in the United Statss, began to be discussed by prominent parties deeply interested in the growth and prosperity of this great interest. A thorough expression of the sentiment of railway men, inventors and manufacturers of railway appliances hes dnring this period been obtained, the universal tone of which has been in favor of the proposition. The resnlt has been the appointment of a board of commissioners to arrange for and conduct such an exposition. The Inter-State Exposition buildings, loceted near the business center of the city of Chicago, on the shore of Lake Michigan and convenient to the depots of the various railways, have besn secured. Theee are the largest exposition buildings in thie country, and are especially adapted to the pnrpose in question. The main building is 800 ft. long and 200 ft. wide, has a capacious gallery one-third of a mile in length, and is provided with an abundence of steam power for operating machinery. Railway tracks will be laid the entire length of this building for the accommodation of cars and locomotives and for nse in making teste, which will hs connected with the tracks of the Beltimore & Ohio, Illinois Central and Michigan Central roads, running within a few feet of its eastern wall. Favorable ratee will be given by the railways of the country for the transportation of articles intended for exhibition and excursion parties desiring to attend.

A series of scientific and practical tests, to be made hy well-known scientists and carefnlly selected committees, extending to every article and every description of material susceptible of reliable test, will constitute oue of the most interesting as well as most valueble features of the Exposition. An official record of these tests and of every exhibit, including a list of prizes awarded, will he made and published under direction of the Commissioners. Exhibitors will bs required to pay a reasonable fee for themselves and for employeee in charge of exhibits, and an extra sum for each class in which they may desire to competes for a prize, to defray the expense of conducting tests and examinations and of providing medals. Every dollar of the proceeds of the Exposition, after defraying necessary expenses, will he devoted to hsnevolent purposes connected with the railway servics, to he hereaftsr designated hy the Commissioners. A large gnarantee fund has been raised in Chicago, sufficient to insure the finaocial stability of the Exposition.

No officer or commissioner will receive any salary or compensation for his services as such, the good of the great interests named and of the army of employees connected with them being the only incentive to the labor which he shall perform.

The Exposition will open on or about Thursday, May 31, and close on or about July 7, 1883, and the time for preperation being thus limited, it ie important that all who intend making exhibits shall hegin necessery preparatione at once.

It is helieved that an exhibit can he organized which, in ite henefite to the more intelligent maesee, and especially to the officers and employeee in the railway eervice, and all who are intereeted in the manufaoture of railway appliances, and ae a contribution to the world's etore of technicel and practical knowledge, hae never been equaled. It is to be hoped that all who are direotly or indirectly interested in supplylng railwaye, either with materials or manufactured articlee, will take interest in thie matter, and that every deeerviog article properly coming nnder the head of "railway applianoee" may he creditably reproeented at the exhibition. The officere are: President, Hon. Luicins Fairchild; Vice-Presidente, George M. Pullman, President of Pullman's Palace Cer Co., and Aaron French, Pittsbnrg Car Spring Co.; Secretary, E. H. Talhott, Manager of *Railway Age*, Chicago; Treaeurer, J. McGregor Adame, of Adams & Westlake Mfg. Co. All correspondence may he addreesed to the eecretary. There ie a firet-clase ohanoe for inventore to exhibit their railway appliances to the very people who muet become the purchasers. We hope the Pacific Coast will not be behind hand.

Early History of the Comstock.

[Written for the PRESS.]

Two different statements having been made pnhlic as to the firet assay of Comstock ore, and which first developed the value of that wonderful lode, I deem it proper, being in possession of positive data, and ee a matter of correct history, to place the same on record.

The very first assay of the ore was made hy Mr. Melville Atwood, M. E., of Grass Valley, and was made June 27, 1859. It was as follows: Silver, $3,000; gold, $876; total, $3,876. The buttons of thie assay were presented to me by Mr. Atwood in 1869, and being still in my possession, can be seen by the curious at my office in thie city. This assay was made at the request of Judge Walsh from pieces of "black stuff," as Comstock called it, bronght over by Mr. B. A. Harrison at the request of Mr. Stone. This assay started a number in the secret to the new El Dorado. I was informed of it in a little while. Being at that time correspondent of the *Bulletin*, of this city, on June 30, 1859, I wrote to that paper as follows: "There is considerable of a stir hereabouts concerning a great discovery up north; men are leaving hourly. The account is that a lead has been discovered which can be traced six miles, and all of it rich with silver and gold, and hy assays will pay thousands a ton." In due time Mr. Stone visited Nevada City and brought with him some of the "black staff" (sulphuret and chloride of silver) and had the same assayed by Mr. J. J. Ott, of Neveda City. Thie was July 28, 1859. The result of the assay was: Silver, $1,975.75; gold, $964.97; total, $2,940.71. On receiving this essay Mr. Stone impartsd the information to several of his friends, who communicated it to others, and all information confirming previous accounts, there commenced a great stampede among Nevadians. Every available animal was soon secnred, and every mile of the road from Nevada City to Washoe had a Nevadian on it, with Mr. Stone in the van.

I was among the first who knew the result of both assays, but having a quartz mill and a large quartz interest near Nevada, I felt no inclination to engage in the venture. I kept, however, well posted, my main correspondent being George Hsarst. In one of his letters he said: "You will know of tons of silver and gold leaving here every month." George returned to Nevada City for more coin, and came up to my mill to see me, to induce me to go over and build a mill. Said he: "If you will not leave this mill, go get an armful of ehavings, set it afire and hurn it up, or give it away, and you will make money by doing so and going." I never had better advice given me. I knew George meant all he said, and it put me into a deep study, which in due time resulted in my saying to him: "*I have made up my mind to go!*" This was in the latter part of 1859. I at once started in making arrangements to leave, and wrote to my partners in San Francisco my determination. They protested, but I had made up my mind to go, and there was no moving it. The mill was put in charge of another party, and I repeired to San Francisco. A company was formed first of 10 members and shares; then others wanted to come in, and it was made up to 15, then to 20. It was deemed advisable for me to personelly inspect the lode before going further, as we were contemplating large investments. This accorded with my idea, and as soon as practicable I visited and inspected the lode, and my report would do to read at this date. I returned to San Francisco. Then was formed the "Washoe Gold and Silver Mining Co., No. 1. Nathaniel Gray, President; D. A. Jennings, Secretary." Machinery was at once ordered, and in May, 1860, I commenced building and in due time started in successful operation the first mill of the State of Nevada. No sooner was the first mill of 24 stamps completed than was commenced the second one of 48 stamps, and others followed. I soon realized the prophstic worde of Mr. Hsarst by seeing "tone of gold and siver leaviog every month." Nevada is well named, for Nevadians poured first into her borders, brought forth her richee and gave to her their unbounded energy and capital for her development. They, as a whole, fared well for eo doing.

Thus you have the facte of the small heginning of eomewhere near $400,000,000 of gold and eilver as product of the Comstock. As I look hack, all is as vivid as though it were hut yeeterday, and yet it eeeme a gilded dream.

ALMARIN B. PAUL.

San Francisco, Decemher, 1882.

A BIG DITCH ENTERPRISE.—The Sonth Yuba Canal and Mining Co. will to-day commence building a new ditch to convey water for mining purpoeee from the end of the Cascade ditch at Quaker Hill down the ridge, a dietance of 12 miles, to Town Talk. Thie ditoh will supply water to minee on Gold Flat and vicinity in thie district, and also to the mines in the vicinity of Wolf Creek, Grass Valley dietriot. The consummation of tbis enterpriee will enable mining operatione to he carried on euccessfully in a large and rich section, which, through a lack of water, hae heretofore been comparatively unproductive. The di ch will have a capacity of 1,500 inches, and cost the projectors not lese than $20,000.—*Nevada Transcript.*

IT is expected that a decree will be iseued in a few daye degrading Arabi and the other condemned Pashas, and ordering the confiscation of their property.

The Judson Manufacturing Company—A Nursery of Pioneer Industries.

Standing on the wharf in San Francisco and looking towards Oakland, three groups of buildings are to be seen stretching along the Contra Costa plateau, all conspicuous by reason of their size, isolation and considerable number. The first set of buildings in this series, consisting of several low wooden structures, painted a brownish red, embraces the works of the Judson Manufacturing Company. The next, two miles further south, standing on a low eminence close in under the Contra Costa range, and comprising several tall brick edifices, is the Asylum for the Mute and the Blind. The third, half a mile further on, and made up of a still larger number of buildings, capacious, stately and with more pretensions to architectural display, being the University at Berkeley. One of these clusters of buildings is, then, an industrial establishment, one a home for the unfortunate, and the other a high seat of learning. The first owes its existence to the enterprise of private individuals, the others to the liberality of the State, which, having established, continues to make provision for their support.

The Operative Works of the Judson Manufacturing Company.

Are situated in the western part of the city of Oakland, the grounds they occupy extending from the bay eastward across the track of the Central Pacific railroad. They are distant about one and one-half miles from the end of the mole at which the San Francisco and Oakland ferry boats land, and can be reached in 35 minutes from this city. The buildings, some nineteen or more in number, consist of rolling mills, foundry and of machine work and construction shops of various kinds, the whole covering an area of several acres. Though of plain exterior they are models of neatness, well designed and substantially built, each one having been arranged, outfitted and otherwise especially adapted for carrying on the branch of business assigned to it. They are all new, some of them not yet quite finished, scarcely more than six months having elapsed since ground here was first broken.

Without going into a detailed description of the engine and boilers, the great wood end iron turning lathes, and other powerful and complicated pieces of mechanism, or of the innumerable tools and utensils provided here, it will be enough to say that in their equipments these works are very complete, the machinery in every department being of the most recent and approved patterns, some of it including improvements but lately introduced in the East. There is not on the coast an establishment of the kind more perfect in its appointments than this. No pains or expense seem to have been spared in securing the best appliances extant, some of the devices here employed inuring superior work, while they largely encourage labor. Iron tracks for cars have been laid through the grounds and buildings also, connecting the latter with the railroad, greatly facilitating the shipment and delivery of freight.

In the location and construction of these works

Sanitary Considerations

Have not been neglected. The grounds are thoroughly sewered also. Standing on the verge of the bay, any filth that might otherwise accumulate on the premises is carried away by the ebbing and flowing tide, while the prevailing winds come to the place free from the stench of sewerage or other impurities. The foul atmosphere, smoke and other causes of disease and discomfort common in most manufacturing districts, and present in all large cities, can never here be source of serious annoyance. With the exception of the rolling mills and foundry, the buildings, all well lighted, stand up several feet from the ground, which, admitting the free passage of the air under them, serves to keep them well ventilated, various other measures tending to promote the health and comfort of the workmen having been adopted.

Diversified Pursuits.

Besides the business pertaining to the rolling mills and foundry, the manufacture of nails, tacks, brads, files, hardware, etc., will be carried on here; also the making of the California Victor mowing machines and other agricultural implements, it being the intention to add such new branches as may hereafter be found expedient. The present establishment is, in fact, itself the product of a sort of industrial evolution, having grown out of the enterprise set on foot two years since by the California Iron and Steel Co., in which latter we have the germ—the protoplastic idea, so to speak, of these new and multifarious works, which, though not extensive compared with some of the great establishments of older countries, have still a large productive capacity. The Judson company, while shaping their policy with reference to present wants rather than the requirements of a remote future, have at the same time so planned and built that they can easily enlarge their works if necessary. That some enlargement will in good time take place, and other industries be engrafted on the present stock, is a thing to be looked for.

Coming into Market.

Some of the products of this company have already been put on the market, and met with great favor. Some 8,000 or 9,000 tons of the iron made at their works in Placer county have been disposed of, selling, because of its good quality, at somewhat higher prices than the imported article. Two weeks ago the first lot of tacks ever made in the State were turned out at the Oakland works, which will hereafter make about a ton of these articles daily. Hardwares of many kinds is also now being cast at the foundry, and some time in January the rolling mills will be turning out bar and other forms of wrought iron, in considerable quantity.

The Beneficent Effects of these New Industries

So being built up by the Judson Manufacturing Company will be marked and manifold. In the first place, much money will now be retained in the country which has heretofore been sent abroad for purchasing the various commodities made by them. Then employment will be furnished for a large number of men and boys at good wages, several hundred hands being now employed by the company, with the prospect that their working force will very soon be still further increased, and finally, many other kinds of business will be benefited, and property in the vicinity of these works be enhanced in value, such having been the case to a perceptible extent in the neighborhood already.

In no other country, perhaps, is so much iron used in proportion to the population as in California, our annual consumption of pig iron amounting to about 35,000 tons, supplied at

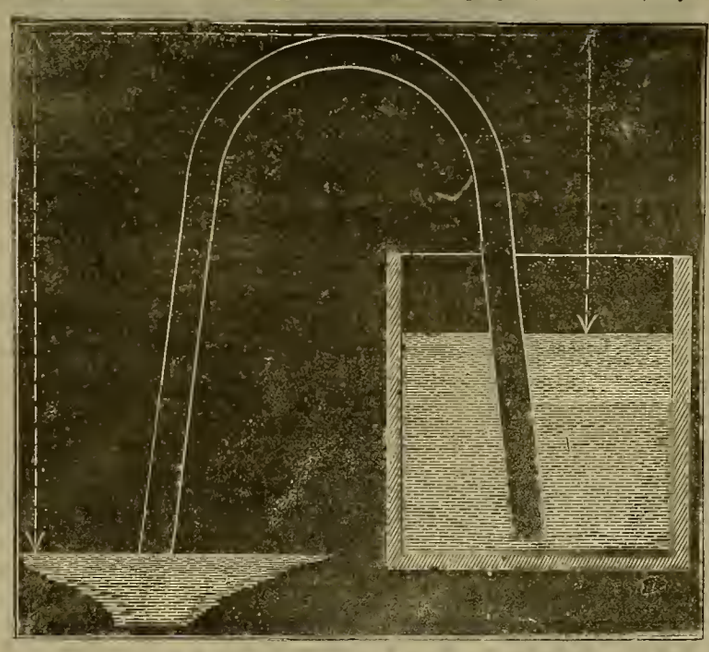

DIAGRAM ILLUSTRATING PRINCIPLE OF THE SIPHON.

a cost of a million and a quarter dollars. Up till April, 1880, when the California Iron Company started their furnace, the whole of this iron was imported into the State, a small portion of it coming from Oregon. An account of this company's properties, works and operations, including a minute and accurate description of their furnaces, will be found in the forthcoming report of Henry G. Hanks, State Mineralogist, wherein the entire subject of our iron interests, resources and industries are fully treated of.

A Hard Worker and a Public Benefactor.

While a number of our prominent business men have been connected with this enterprise from the first, it has found its prime mover and principal promoter in the person of Egbert Judson, the founder of several other important industries, some of which had their inception in that early period in our history when limited demand and dear labor rendered manufacturing costly and success doubtful. Judson was the pioneer manufacturer of powder, acids and candles in this State, having engaged in the latter at a time when it met with many discouragements, speculators and jobbers opposing it because it tended to interfere with their business of buying up stocks and creating corners in the market, and consumers because of their prevailing prejudice against everything of home manufacture. And thus it required years before the California-made candle came into general use, notwithstanding it was of equally good quality and sold at less price than the imported article. In the matter of powder and acids the home manufacturer had the speculators at a disadvantage, these being commodities that could not well be imported. Hence these industries sooner gained a foothold and became self-supporting and even profitable.

Having worked these several branches of business up to a paying point, and placed them on a permanent basis, Judson took hold of these other new industries, which, for the past two years, have engaged his attention, and which, though their ultimate success may be considered assured, will require careful nursing to carry them through the critical period that has attended the establishment of nearly every new pursuit in California. Appreciating this fact, the principal mover in this enterprise has proceeded with caution, looking out that nothing shall be overdone at first. He has, moreover, been unwearied in his efforts to see that everything is started and carried on right. A harder worker than Egbert Judson cannot be found in the city. He is constantly on duty—supervises everything, and even gives to details much personal attention.

Mr. Judson is constitutionally active and benevolent. Hence this exertion and use of his means for the benefit of others; his theory being that the best way to assist those who need help is to put them in a position where they can help themselves, to which end he likes to inaugurate new industries, build factories, and in other ways create work for those who need or desire it. And thus he has made himself a very serviceable member of the commonwealth; and had he lived among the ancient Romans, who had a custom of honoring the man who had most distinguished himself for his usefulness, he would have been voted a civic crown and been declared the first citizen of the State.

Let not the newspaper scribe seek to interview Mr. Judson. It would be a waste of time. In the first place, he is a hard man to find, and when found has nothing to say. If you ask him about his various enterprises and projects, intimating that the public might perhaps like to be advised as to how they are getting along and what are the prospects, his answer is, they are merely experiments—don't know how they will come out; better wait and see, when, if successful, it will be time enough to say something about them, and with this he betakes himself to business or strides off, the head in advance of the rest of the man, that the thinking part may arrive and get to work first.

Though a close reasoner and endowed with warm sympathies, Mr. Judson is an altogether matter-of-fact man. He has not much to do with sentiment or speculation but seeing his objective point, goes straight for it, being as direct as a sunbeam and as practical as a steam engine.

A New Mine.—M. San Pedro, of Grantsville, Nye county, one of the most energetic miners in Nevada, went below Saturday evening, says the *Reno Gazette*, to make arrangements for opening a mine about twenty-two miles east of Luning, which he has bonded for $32,000, paying $2,000 cash for the bond, which runs sixty days. He believes it is one of the biggest mines in the world. A crosscut shows the vein to be 110 feet in width. Though the ore is comparatively low grade, there is sufficient of it to keep any number of smelters running continually. It carries about $25 per ton in silver and enough lead to pay working expenses. A road to the mine will be constructed and a town laid out. That section of the country is coming to the front rapidly. A grand mineral domain is being opened up, and in a few years it will be the most prosperous section of Nevada. The Carson and Colorado road is the great factor in the grand improvement. Four years ago most of the country through which the Carson and Colorado now runs was the most Godforsaken region in the world. Now there is a chain of thrifty camps for more than 100 miles that will develop into lively towns before many months.

The California College of Pharmacy contemplates erecting a building and equipping it with apparatus necessary for their use, and to this end an appeal is made to druggists, pharmacists and the friends of pharmaceutical education on this coast generally, to contribute $6,000, the amount that will be required to carry out the project.

The Siphon.

A siphon possesses no power, and can do no mechanical work. It cannot raise water from a lower level and permanently deposit it on a higher level. But it can take water from a higher level and place it on a lower level, and in doing so convey it over points higher than that from which it started. The siphon, theoretically, will, after the manner of the suction of a pump, cause water to rise over a point equal to an atmospheric column—namely, 33 feet; but, like a pump, it works not beyond 27 feet in practice, should never have to work higher than 21 feet, and the less the hight the better it will work. A siphon will not work unless the delivery is below the feed, and unless the pipe and joints are perfectly tight. It may be useful to a reader here and there to explain briefly the action of the siphon. Mr. C. M. Percy, of Oregon, who is writing a work on the "Mechanical Engineering of Collieries," says:

The siphon is a bent tube open at both ends, and having one leg less in vertical hight than the other. (See engraving.) If such a tube be filled with water, and placed with the extremity of the shorter leg in a vessel also containing water, the water will flow out through the longer leg. If the vertical hight from the surface of the water in the vessel to the top of the siphon be the same as the hight of the other leg no delivery will take place, because the pressure of the atmosphere will be acting on two identical columns which will exactly balance each other, and there will be no tendency to motion in any one direction more than than the other. But if, as shown in the engraving, the vertical hight from the level of the water in the vessel is greater than the vertical hight of the other leg, equilibrium ceases. The atmospheric pressure is the same on both sides, but one column is longer than the other, and the water flows down that, causing a vacuum. The pressure of the atmosphere acting on the surface of the water in the vessel forces the water up the shorter leg to fill up this empty space. Thus motion begins and continues.

Wood River Smelters Closed.

From the Ketchum *Keystone* of Nov. 24th we take the following: The fires at the Philadelphia company's smeltere were allowed to die out yesterday afternoon and the season's work brought to a close. The works have, under the circumstances, made a very continuous run since their second starting in August, and their record will prove a credit to Wood River. Many and intricate have been the difficulties the company has had to overcome this season, but another year will give them many advantages over the past. One furnace will be blown in about the first of next May, and it is thought that by the first of June ores will be arriving in sufficient quantities to warrant the starting of the second furnace and keeping the two in operation until the middle of December at least. Together with the greater activity in the production of ore, the company will have the advantage of railroad transportation next season. It was expected to operate both furnaces for a month or six weeks this fall, but the unlooked for snowfall in the ranges last month shut off and limited the ore supply to such an extent, and owing to railroad work making a heavy demand on the teaming outfits, it was found impracticable to do so. There are 300 tons of bullion at the smelters which must lie over until the advent of the railway.

A Gold Capped Mountain.—The Arizona *Miner* says: In the early history of the settlement of Northern Arizona, near Weaver, on the top of a high mountain was discovered by a band of brave pioneers the most marvelous placers, for their extent, ever found in any country. Upon about half an acre of ground was secured over $1,000,000 in large sized nuggets. The country surrounding had plenty of gold in the earth, but owing to the scarcity of water and the character of the clay in which the fine particles of gold are imbedded, as yet no great headway has been made in making fortune; however, it is and has been the opinion of mineralogists and scientific men that very rich ledges exist in and around Weaver. To a limited extent developments have been made with very satisfactory results. The Leviathan is a mere mouth deposit. In close proximity to the Leviathan is the Marcus mine. This ledge has received some development, and has suprised its owners by producing ore worth thousands of dollars per ton. Adjacent to the Mercus is being opened the Van Arnam, which, at the depth of ten or twelve feet, has a vein of ore twelve feet wide, assaying over $300 to the ton. Weaver district has many other ledges marvelous in richness. We venture the assertion that ere long Weaver will outdo Virginia City in its palmiest days.

The following dispatch was received from Kingston, Jamaica, on the 12th: The business quarter of Kingston was burned yesterday. Loss, £6,000,000. Hundreds of people are homeless. Wharves, warehouses, stores, banks and supplies are gone. Food supplies are needed. Charitable relief should be sent to W. K. Azhill, Secretary Kingston Charity Organization.

CHICAGO **FRASER & CHALMERS.** ILLINOIS

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns meet extensive use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. R. Haggin for Giant and Old Abe Co., Black Hills also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars. **McCaskell's Patent Car Wheels and Axles—Best in Use.**

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. **New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.**

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

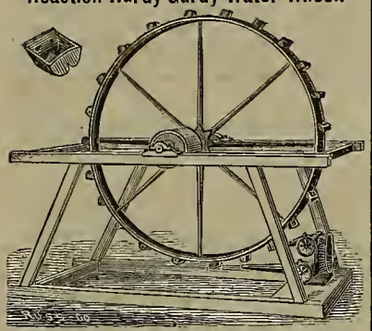
HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

PELTON'S PATENT
Reaction Hurdy Gurdy Water-Wheel.



This Wheel will be guaranteed to purchasers to give 83% of the theoretical power of water. Send for circular to L. A. PELTON, Nevada City, Nevada Co., Cal.

QUICKSILVER.

THE CELEBRATED **A** BRAND.

Shipped Direct from the New Almaden Mine,

New Almaden Station, Santa Clara Co., Cal.

For sale in any quantity. Trademark A on top of Flasks secured by United States Patent, and registered. Flasks contain 76½ lbs. Quicksilver. Weight and purity guaranteed.

CARLOAD LOTS will be shipped from San Jose, f. o. b., for Nevada, Arizona, New Mexico, Montana and Idaho or Utah, or delivered at Pacific Mail Steamship Co.'s wharf, and Depot of S. P. R. R. Co., San Francisco, without charge. Railroad rates from San Jose are the same as from San Francisco.

J. B. RANDOL,

P. O Box, 1078. 320 Sansome Street. S. F.

The Explorers' Miners' and Metallurgists' Companion.

Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy,

Containing 672 Pages and 83 Engravings, BY J. S. PHILLIPS, M. E.,

Of California, a Practical Operator for Thirty-eight Years; Explorer and Resident in the Pacific States and Territories for the past Twelve years.

PRICE—bound in cloth, $10.50; in leather, $12.

For sale at this office.

KNIGHT WATER WHEEL

All sizes of this Superior Wheel furnished at the shortest notice. Send for circulars to

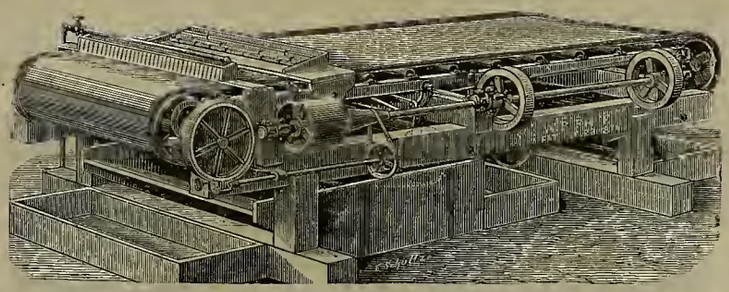
The most complicated cases of defective vision thoroughly diagnosed, free of charge. Orders by mail or express promptly attended to.

Compound Astigmatic Lenses Mounted to Order. Two Hours Notice.

$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR,

—OR—

VANNING MACHINE.

Over 400 are now in use, giving entire satisfaction. Saves from 40 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal.

A machine can be seen in working order, and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont Street.

To those intending to manufacture or purchase the so-called "Triumph" Concentrator, we herewith state:

That legal advice has been given that *all shaking motion* applied to an *endless traveling* belt used for concentration of ores is an infringement on patents held and owned by the Frue Vanning Machine Company.

That suit has been commenced in New York against an end-shake machine similar to the Triumph, and that as soon as decision is reached in the courts there, proceedings will be taken against all Western infringements.

That the patent laws make *users* of infringements responsible as well as makers, and the public is therefore warned that there is considerable risk in purchasing any end-shake machine until our various patents have been decided.

That if there are those who for any reason prefer an end-shake machine, we can manufacture and sell to such a machine of that description, as efficient as the Triumph, and at a lower price, and no liability for infringement will then be incurred by the purchaser.

That we shall protect ourselves against any one making, selling or using any machine infringing any of our patents. Patented July 9, 1867; May 4, 1869; Dec. 22, 1874; Sept. 2, 1879; April 27, 1880. Patents applied for.

That we are, and have been, ready at any time, to make a competitive trial against the Triumph, or any other machine, for stakes of $1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Company,

Room 7, 109 California Street, - - - - SAN FRANCISCO, CAL.

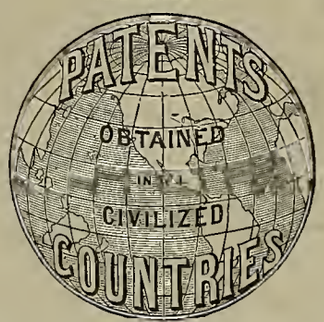
The best of



Through Dewey & Co.'s Scientific Press Patent Agency.

No. 252 Market Street. Elevator, 12 Front St., S. F. Telephone No 659.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long established, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free. DEWEY & CO., PATENT AGENTS,

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co. in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

TANK SPOUT.—Jackson H. Dunlap, Turloch, Stanislaus Co., Cal. No. 268,467. Dated Dec. 5, 1882. This invention relates to an improved water spout specially adapted for railway tanks, from which the locomotive tender is supplied with water. The invention consists in a spout having two hinge joints, one of which adapts it for a horizontal or lateral adjustment and the other for a vertical adjustment, and it also consists in the peculiar construction of said joints, whereby the adjustment is accomplished and a water-tight connection preserved. The object of this invention is to provide for the ready and accurate adjustment of the spout to the locomotive tender. The spouts now in use are adapted to be turned up or down, but have no lateral adjustment, so that it sometimes becomes necessary to move the engine several times before its tender is finally brought in a position to receive the spout. This difficulty is overcome by combining in a spout a means for obtaining the two necessary adjustments—namely, vertical and lateral—so that the engine may stop within a convenient distance, and the spout be at once fitted to the tender without having to move again.

BALING PRESS.—Henry C. Arnold, Visalia. No. 268,598. Dated Dec. 5, 1882. This is an apparatus for baling hay, cotton, etc., and it consists of three boxes of the size and shape to receive the material and form the bale. These boxes are connected with and fixed to a central support having a stout vertical shaft about which it rotates, with the press boxes extending outwardly in radial lines from the center, and equidistant from each other. Opposite the outer end of one of these press boxes is a feed box, through which material is introduced into the interior until the press is full. Opposite the next one is a horee or other power, hy which the follower is moved and the contents of the press are formed into a hale, and which may be tied and ejected when the box reaches the third position. Each press box is brought opposite the feed box, then opposite the pressing apparatus, and finally opposite the point of discharge, the work being thus made continuous.

SHOW-BOX FOR JEWELRY.—Leonhardt Breidenstein, S. F. No. 268,454. Dated Dec. 5, 1882. This invention relates to a novel construction of boxes, which are intended to contain rings, pins and other jewelry, and it consists of slots or openings into which the article is to be fitted, these openings having one or both sides made elastic, or with elastic springs behind, so that an opening will easily be made for the introduction of articles of different sizes, and they will be held firmly in place. The device may be employed in single boxes for rings, pins, etc., or in boxes for sets, or in larger boxes where a considerable assortment may be displayed, and it enables one to place rings or other articles of various sizes in any one of the compartments on account of the adjustability of the opening.

WINDOW SCREEN.—G. L. Reynolds, Oakland. No. 268,125. Dated Nov. 28, 1882. This invention relates to certain improvements in window screens of that class in which upper and lower wire or other screens or curtains are attached at one end directly to the sashes, so that when the latter are raised or lowered to open them the screens or curtains will be extended over the opening, and thus exclude flies and other insects without excluding the air. The invention consists in a means for attaching the screens or curtains at the top or bottom of the window so that they may be easily detached; a means for keeping the edges of the screens tight, and also the space between the lower bar of the upper sash and the glass of the lower one, and the construction of the screen-weight which allows it to pass the pulley at the top, and thus have more distance through which to move.

LAMP.—Vincent Di Marco, of Benicia, Cal. No. 266,114. Dated Nov. 28, 1882. This invention relates to a self-regulating lamp, and it consists in the details of construction of a lamp having an elevated oil reservoir, and a receiving chamber into which the oil flows through a passage, the valve of which is opened or closed by levers connected with a float rising and falling with the oil supply. The movement of this float also actuates a wick-ratchet, so that the wick may be constantly renewed. In connection with the apparatus is a cut-off valve, also actuated by a float, so that in case of a failure of the supply-valve to act this one will be moved by the overflow, and will entirely cut off the supply.

LEAK-STOPPER FOR BOILER TUBES.—William F. Thompson, S. F. No. 268,571. Dated Dec. 5, 1882. This invention relates to a device for stopping leaks in boiler tubes, and it consists of a short section of tube small enough to enter the leaky boiler tube, provided with a longitudinal tapering slit and a wedge actuated by a transverse lever-arm, one end of which rests upon the edge of the tube and the other in a recess in the wedge. A rod is hinged to its center and extends back through a small tube, so as to be operated from the front, and thus force the wedge into its place, after which the rod and lever may be removed, leaving a clear opening through the boiler tube.

SMOKE CONSUMING FURNACE.—Peter H. Jackson, S. F. No. 268,682. Dated Dec. 5, 1882. This patent covers certain improvements in the combustion of fuel and an apparatus by which it may be carried out. It consists of a fire-box to contain the fuel, with exterior and interior passages, by which air is supplied at the bottom and top and through the fuel from the sides. The invention also consists of certain details of construction. A self-regulating valve or damper in the escape-pipe controls the discharge of the products of combustion.

BOILER SCRAPING ATTACHMENT.—James M. Lakenan, Grass Valley. No. 268,504. Dated Dec. 5, 1882. This invention relates to an apparatus for scraping the interior of boilers, and in connection therewith of a joint through which the operating rod of the scraper passes, and which allows it to move from side to side within the boiler so that the work may be done at any time without running the steam down or in any way interfering with the machinery.

WASHER CUTTER.—Christopher C. Maltby, Chico, Cal. No. 268,509. Dated Dec. 5, 1882. This invention relates to an improved washer cutter, and it consists in a novel arrangement and construction of the stock, spring-center, cutting-arms and set-screw. The object of the invention is to provide a washer cutter easy of adjustment and effective in operation.

SOFA-BEDSTEAD.—Robert W. Taylor, of San Francisco. Sofa-bedstead. No. 268,145. Dated Nov. 28, 1882. This invention relates to the class of sofa-bedsteads and to certain new and useful improvements therein, consisting in sundry details of construction. The object of this invention is to provide a neat, convenient, strong and durable sofa-bedstead.

ENGINEER.—Parties wishing an engineer, in the city or in the mines, are invited to correspond with "C. F. B., engineer, No. 1323 Fourtenth street, Sacramento."

AN enricher of the blood and purifier of the system; cures lassitute and lack of energy; such is Brown's Iron Bitters.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men

N. H. HAPGOOD—Plumas county.

ANNUAL STATISTICIAN of 1882.—"It is the most complete and accurate work of its kind in the world."—*S. F. Call.* Address L. P. McCarty, 502 Taylor st. Price, $4.

Notes From Eureka, Nevada.

[From our Regular Correspondent.]

In my last I promised to give you a description of the Albion, but unexpected business prevented me from going to that mine to-day, and I am compelled to postpone it. The tubes for the flue dust arrestors have been hauled to the furnaces, and are being placed in position. Reports from the mine are highly encouraging, and quite a village is springing up around it and the furnaces.

On Adams' Hill

Prospectors are, as usual, hammering away, with little change worthy of note. The Silver Lick Co. have been doing assessment work on the Protection location. In running an open cut on some croppings good ore was discovered. The workmen have secured a lease of the place, and from present appearances, will make a good thing of it.

Messrs. Molino & Frazer, who leased the old Silver Lick workings, nearly three weeks ago, have about 18 tons of ore on the dump worth, it is estimated, from $150 to $250 per ton, and it is said are now making, each of them, $100 per day.

At the Richmond and Eureka Con. nothing of interest has happened during the week. The Richmond Co. are running a quantity of slag from the south end of the dump through the furnaces, at a profit of $6 per ton. This goes to show that experience has taught economy, or that the art of saving the precious metals is better understood than formerly.

At the Bowman mine the ore bodies are showing considerable improvement. On the 100 level a favorable place was passed unnoticed for a long time, but a winze sunk on it about 13 ft. has disclosed a fine body of quartz, that assaye over $100 per ton. Ore is being taken from other places in the mine in small quantities. There are about 15 tons on the dump.

On Prospect mountain the mines are looking prosperous. At the 'Silver Connor" the usual amount of high-grade ore is being sent to the surface, and the immense bodies of low-grade ore, for which that mine is famous, are allowed to remain undisturbed.

At the Dead Broke there is enough ore stripped in the mine to realize nearly $40,000. Shipments are being made to the Albion furnacee on trial.

At the Republic three men are employed, one of them taking out quartz ore for flux, and the other two are driving a tunnel to get under a well-known ore body.

From the Industry mine some splendid looking ore is being extracted. This property I shall notice at greater length at future leisure.

A good prospect is in development in the El Dorado Con. at a point nearly even with the top of the main shaft, and probably 250 ft. west of it. A new seam of ore of precisely the same character as the first body found in the south drift from the Eureka tunnel has been opened up for a short distance. The vein is of a quartzy natnre. It carries a great desl of black oxides of manganese, yellow carbonates and some black metal.

At the Eureka Tunnel

Everything is assuming a business-like air that has not heretofore characterized its surroundings. An engine and fan placed at its entrance forces air through the mine and facilitates the work at every point, but as the work of development progresses so increases the need of more fresh air, and it will soon become necessary to procure the machinery for the purpose of supplying it.

In the south drift men are at work driving ahead towards the El Dorado Con. shaft, and are making good headway. The drift is being run on the slip on which the first ore body was found, and it is reasonable to believe that similar ore bodies will be discovered on the same seam. From the 105-foot level, east crosscut, is a drift running a little west of south from what is marked in the company's working map as the "ore hole." The end of the drift brings you to what appeared to be the termination, at one end, of the No. 2 ore body. From this point a winze has been sunk 23 feet to the station, following an almost imperceptible ore seam; but the ore widened, and became stronger in every direction as depth was gained. At the station it is in one place six feet thick, width unknown.

The incline winze a little west of north on ore is down 17 ft., with the vein dipping E. N. E. From this point a drift has been run 6 ft. south on soft carbonate ore (the ore up to this point is a semi-hard carbonate), assaying as high as $170 per ton. From the same point in a south-easterly direction is a raise from which the ore extracted was from 3 to 6 ft. in thickness, and 7 to 8 ft. in width. From station down to the bottom of the *straight winze* is also a drift running south in 10 ft. on ore. In fact the ore bodies, devil fish like, throw out strong feelers in every direction. In the east stope from the north raise from the "*ore hole*" there was a splendid clean body of ore (it did not need assorting) that at one place was from 8 to 10 ft. thick. The vein ran off nearly north and south from this point, and up to the present time has been stoped out for a length of 300 ft. From top to bottom of this stope, on the dip, measures 30 ft. at the highest point, and in places it pinched out to nearly nothing, as is the case near the north end. This is one of two places on the stope that is yielding ore at present, and at this extreme end the body has again increased in size to about 30 inches in thickness. It is, however, raising towards the tunnel level, and the air is too light to make long visits pleasant. This, however, will soon be remedied. A drift has been run in 25 ft. from a point 75 ft. east of the main shaft, and here a winze is being sunk to make air connection. The ore shipped from the Eureka tunnel during the past week to the Eureka Con. furnaces realized $5,000 after deducting furnace expenees.

Work was resumed yesterday in the Golden Rule tunnel. In the south drift from the main shaft in the Uncle Sam Con. a body of very hard quartz was struck a few days ago, and ore may soon be looked for.

On Silverado Hill the mines are looking nicely. The Western Globe is showing a vein of rich ore about 8 inches thick, at a point 45 ft. below the new tunnel level, from where a drift is being run southerly on the ledge.

At the Queen mine preparations are being made for another shipment. The ore is very high grade. From the Silver Nugget about six tone of high-grade ore was shipped to-day to the Richmond furnaces.

Money is getting to be a little more plentiful in Eureka, and a firmer feeling is possessing the camp; hence I look for greater activity in mining after New Year. M. H. JOSEPH.

Eureka, Nev., Dec. 11.

DURING the year 1882 to this date, the Central Pacific has delivered 18,000,000 lbs. of freight at Kelton. About one-third of this went to Wood River, while the balance was sent to Boise and other places in Idaho, including a large amount in the way of supplies to the grading camps on the Oregon Short Line railway.

REPRESENTATIVE PAGE has presented in Congress a memorial of the State Board of Regents of the University of California, asking Congress to modify the law so that they may invest the funds derived from sales of lands in securities, and find a lower rate of interest than 5%.

BROWN'S IRON BITTERS

will cure dyspepsia, heartburn, malaria, kidney disease, liver complaint, and other wasting diseases.

BROWN'S IRON BITTERS

enriches the blood and purifies the system; cures weakness, lack of energy, etc. Try a bottle.

BROWN'S IRON BITTERS

is the only Iron preparation that does not color the teeth, and will not cause headache or constipation, as other Iron preparations will.

BROWN'S IRON BITTERS

Ladies and all sufferers from neuralgia, hysteria, and kindred complaints, will find it without an equal.

A California Success.

Happening to know personally the facts, it is but justice for us to state that the fine organ manufactured by Mr. John Bergstrom, of San Francisco, and exhibited in the Mechanics' Fair of 1876, has, by time and use, proved that the high meed of praise then bestowed upon it by some of the best musical critics in attendance was not over stated. The organ has performed excellent service in Hamilton church, Oakland, since the spring of 1877, having constantly been much used for congregation and concert purposes from that day to this. Although the best makers in Massachusetts and England have sent samples of their highly reputed instruments for several elegant churches in Oakland, none of them have yet equaled the California production of Bergstrom in its fullness and sweetness of tone and easy and perfect action. None other has yet proved so popular with the best of performers or their delighted listeners. It is the more pleasant for us to make this statement at the present, from the fact that we learn that one of the leading churches of Oakland has lately furnished Mr. Bergstrom an order for a new organ, which may confidently be expected to far excel anything that has been received in that city from abroad, if it does not even decidedly eclipse Mr. Bergstrom's earlier efforts.

MR. PAGE has presented in the House recently a petition of citizens of California to the Tariff Commission, recommending an increase of duty on chicory. The petitioners claim that this industry needs protection, and that the reduction from five cents to one cent per pound has practically ruined their business.

THE action of Bishop Donhumel, in excluding from the sacrament Irish Catholic parents who allow their children to attend the Normal School is causing great excitement in Ottawa, Ont.

AN invaluable strengthener for the nerves, muscles and digestive organs, producing strength and appetite, is Brown's Iron Bitters.

Mining and Other Companies.

Persons interested in incorporations will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for advertising.

MINING MACHINERY A SPECIALTY.

Our manufactures of mining machinery embrace every kind of machine and appliance for the mining and reduction of ores.

We have had an experience of more than twenty years in the manufacture and practical operation of mining machinery in Colorado and the neighboring States and Territories.

Our facilities are superior to those of any manufactory in the West, our works having been recently rebuilt, greatly enlarged and completely equipped.

We invite the investigation of mine owners and mill men seeking machinery. We can furnish, on board, at our works, or set up at the mines anywhere in the Rocky Mountain region, on short notice, the following machinery: Cornish Pumps, Steam Pumps, Stamp Mills for Wet or Dry crushing, Pans, Settlers, Agitators, Retorts, Bullion and Ingot Moulds, Reverberatory Furnaces, Bruckner Cylinders, Revolving Roasting Furnaces and Dryers, Melting Furnaces, Concentrating Machinery, Rolls, Crushers, Conveyors and Elevators, Ore Samplers and Grinders, Hoisting Engines, Water Jacket Furnaces, Slag Pots and Cars, Lead Pots and Ladles, Blast Pipes and Water Tuyeres, Blowers, Cupelation Furnaces, Market Kettles, Wire Rope, Cages, Buckets, Skips, Ore Cars, etc. Estimates furnished and prices quoted on application. No. 49 Fremont Street, San Francisco, Cal.

MANUFACTURERS OF AND DEALERS IN

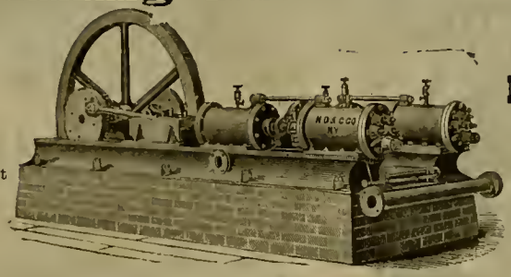
Mining Machinery.

We manufacture the

BEST

Air Compressors

Ever driven by belt from Water Power.



Hoisting Rigs.

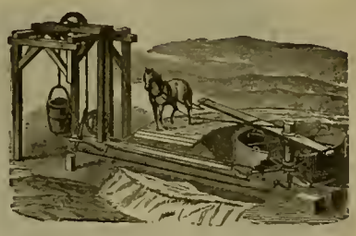
DONKEY ENGINES

For Pile Driving.

MINING CARS,

Ore and Water

BUCKETS.



MINERS' HORSE-WHIM.

One Horse can easily hoist over 1,000 pounds at a depth of 500 feet. The whim is mainly built of wrought iron. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The standard of the whim is bolted to bed-timbers, thus avoiding all frame work. When required these whims are made in sections to pack on mules.

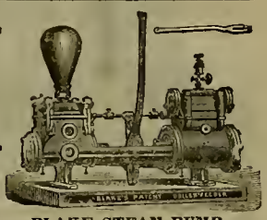
PACIFIC MACHINERY DEPOT.

The Korting's Injector is the simplest, cheapest and best in use. Will draft its own water, hot or cold, and feed under varying pressure. Send for Circular.

H. P. GREGORY & CO.,

Importers and Dealers in Machinery and Supplies.

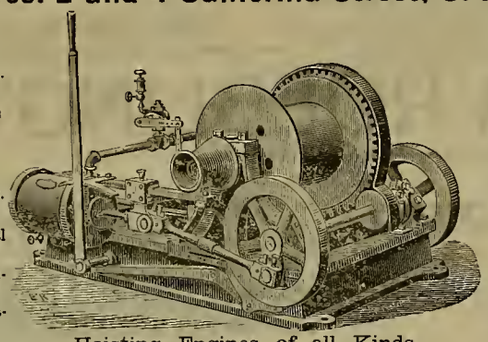
Nos. 2 and 4 California Street, S. F.



BLAKE STEAM PUMP.
More Than 16,000 In Use.

SOLE AGENTS FOR.

Fay & Co., Wood Working Machinery.
Bement & Son's Machinists Tools.
Blake's Steam Pumps.
Perry's Centrifugal Pumps.
Gould's Hand & Power Pumps.
Perrin's Band Saw Blades.
Payne's Vertical and Horizontal Steam Engines.
Williamson Bros. Hoisting Engines.
New Haven Machine Co.'s Machinists' Tools.
Otto Silent Gas Engines.



Hoisting Engines of all Kinds.

SOLE AGENTS FOR.

Sturtevant's Blowers and Exhausts.
Judson's Steam Governors.
Pickering's Steam Governors.
Tanite Co. Emery Wheels.
Nathan & Dreyfus' Oilers.
Korting's Injectors and Ejectors.
Disston's Circular Saws.
New York Belting & Packing Co.'s Rubber Belting, Hose, Packing, etc.
Ballard's Oak Tanned Leather Belting.

THE MOREY & SPERRY MINING MACHINERY CO.,

Successors to MOREY & SPERRY,

Manufacturers of all kinds of

MINING MACHINERY.

Gold and Silver Grinding, Concentrating and Amalgamating Machinery, Engines and Boilers of any size. Hydraulic Giants, Hydraulic Outfits. All the various kinds of Amalgamating Pans, Combination, Eclipse, Excelsior, etc. Settlers, Rock Breakers. Stamp Mills for Wet or Dry Crushing. Howland's Pulverizer, Improved Riffles, Retorts for Gold and Silver, Silver Plated Copper for free Gold Amalgamation. Hoisting and Pumping Machinery, Chloridizing Furnaces, etc. Mining and Mill Supplies of every description. Steel Shoes and Dies that last three times as long as any iron.

WAREROOMS: 92 & 94 Liberty St., New York,

Foundry and Machine Shop: Newburg, N. Y.

NOTICE.—The public and former friends and patrons of the old firm of **Morey & Sperry** are hereby notified that the above-named Company is the legitimate and ONLY successor to the said firm, having acquired all the drawings, patterns and machinery of the of the old firm, together with the lease and good will of its business.

We shall continue the business, with largely increased facilities, at the old place, having made connection with the Newburg Steam Engine works, which have been enlarged to meet the demands of this Company. Mr. Franklin Morey, of the late firm of **Morey & Sperry,** will manage the business of this Company. Information and estimates of the various styles of Mining and Milling Machinery cheerfully given. All orders filled promptly. Materials and Workmanship First-Class.

MOREY & SPERRY MINING MACHINE CO.

Pacific Rolling Mill Co.,

SAN FRANCISCO, CAL.

MANUFACTURERS OF

RAILROAD AND MERCHANT IRON,

ROLLED BEAMS, ANGLE, CHANNEL AND T IRON, BRIDGE AND MACHINE BOLTS, LAG SCREWS, NUTS WASHERS, ETC., STEAMBOAT SHAFTS, CRANKS, PISTONS, CONNECTING RODS, ETC., ETC.

Car and Locomotive Axles and Frames, and Hammered Iron of Every Description.

HIGHEST PRICE PAID FOR SCRAP IRON

☞ Orders Solicited and Promptly Executed.

Office, No. 202 Market St., UNION BLOCK.

READY FOR DELIVERY.

LATHES, DRILLING MACHINES, PLANING MACHINES

and Other Machine Tools,

STRONG, DURABLE AND SUPERIOR TO IMPORTED MACHINES.

Wheel Cutting to Order.

SAN FRANCISCO TOOL CO., - - 21 Stevenson St., S. F.

L. C. MARSHUTZ. T. O. CANTRELL

National Iron Works,

Northwest Cor. Main and Howard Sts., San Francisco,

MANUFACTURERS OF

IMPROVED PORTABLE HOISTING ENGINES

At Greatly Reduced Prices.

HOME INDUSTRY! ALL WORK TESTED AND GUARANTEED!

Stationary and Compound Engines, Flour, Sugar, Quartz and Saw Mills. Amalgamating Machines.

CASTINGS AND FORGINGS OF EVERY DESCRIPTION.

Sole Manufacturers of Kendall's Patent Quartz Mills.

GIANT POWDER.

MANUFACTURED UNDER ALFRED NOBEL'S ORIGINAL AND ONLY VALID PATENT FOR NITRO-GLYCERINE POWDERS.

All Nitro-Glycerine Compounds, for instance, so-called HERCULES, VULCAN, VIGORIT, NITRO-SAFETY Powder, Etc., are infringements on the Giant Powder Co.'s Patents.

THE GIANT POWDER COMPANY

Call Special Attention to their Improved Grades of Powder.

NO. 1.—The most Powerful Explosive Compound now in use here.
NO. 2.—Surpasses in strength any Powder of its class ever manufactured.
NO. 3.—This grade is a Strong and Reliable Powder, which does excellent work.

JUDSON POWDER

Is now used in all large Hydraulic Claims, and on most Railroads. It breaks much more ground, and obviates reblasting by breaking much finer. TRIPLE FORCE CAPS AND ALL GRADES OF FUSE.

☞ The Giant Powder Company have also purchased from Mr. Nobel, the inventor of Nitro-Glycerine, his latest invention, known under the name of

NOBEL'S EXPLOSIVE GELATINE

This explosive is from 50% to 60% stronger than the strongest Nitro Glycerine Compound and impervious to water. Even hot water does not diminish its strength. We are now introducing the same.

BANDMANN, NIELSEN & CO., General Agents, 210 Front St., S. F.

GOLD MINERS

WORKING PLACER, GRAVEL AND QUARTZ MINES,

SAVE YOUR GOLD!

— BY USING —

SILVER PLATED AMALGAMATING PLATES.

The most economical and successful process now in use. Will warrant my Plates to save more gold than any other method, and double the amount of the same surface of ordinary copper plates. The only plates that have proved durable and satisfactory.

OLD MINING PLATES BOUGHT, TAKEN IN EXCHANGE FOR NEW, OR RE-PLATED.

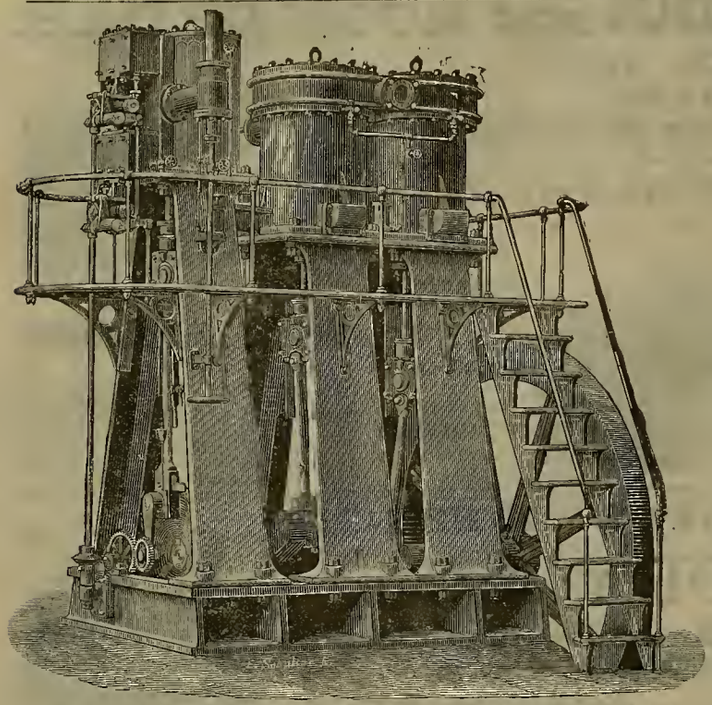
ALL KINDS OF METAL GOODS PLATED!

San Francisco Gold, Silver and Nickel Plating Works,

653 and 655 Mission St., bet. New Montgomery and Third, San Francisco.

Send for Circular EDWARD G. DENNISTON, PROPRIETOR.

Awarded the First Premium at every Fair of the Mechanics' Institute for the last 12 Years.



With Adjustable Cut-off Poppet Valve Engine, and Forced Iron Crank Shafte

Mining Machinery Depot,

PARKE & LACY,

21 and 23 Fremont Street. S. F.

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

THE JOHN A. ROEBLING'S SONS CO.,

Manufacturere of

WIRE ROPE and WIRE

Of Every Description.

For Inclined Plares, Standing Ship Rigging, Suspension Bridges, Ferries; for Mines and all kinds of Heavy Hoisting; for Stays and Guys on Derricks, Cranes and Shears; for Tillers, Sawmills, Sash Cords, Lightning Conductors, etc.
Galvanized and Plain Telegraph Wire.

SAN FRANCISCO, SATURDAY, DECEMBER 23, 1882.

VOLUME XLV Number 26

Shallow or Modern Placers.

These placers, of which there are more in California than anywhere else in the world, are superficial accumulations of auriferous alluviæ aloog the gnlches, bars, flats, etc., and are designated gulch, bar or flat diggiogs, according to their topographical position. The gold-hearing detritus of which they consist has been derived from the anoient placers or the quartz veins, in some instances from hoth sources. Throngh the disintegrating and transporting power of running water the material has been hrought from the sources and redeposited in places of lower elevation, where it was discovered hy the pioneer miners. Thus the assorting process has heen carried, hy natural agencies, one stop farther than in the formation of the gold-hearing quartz veins. To this process of the higher concentration of the gold is due the extraordinary richness of the shallow placers. From the shallow p'acers came nearly all the gold produced hy California in the early times. The exhaustion of the gold gravels capahle of heing worked with profit hy such primitive means as were available at that time led to the ahandonment of the shallow diggings. That all these diggings have been depleted is not true, even with reference to their further working; and considerahle attention has of late heen directed towards resuscitating this hitherto productive hranch of mining. The deposits also often occur helow the drainage level. The flat character of the places where the unworked deposits occur preventing the attainment of the grade requisite for "sluicing" and of the "dump" for the disposition of the refuse, is the chief obstruction to he overcome hy the ingenuity of man hefore the shallow placers can he again profitahly worked.

The gold-saving apparatus of the shallow placer mine, the pan, cradle, tom, sluice, etc., are now objects of hardly more than hietorical interest. From their nature, accompanied with the illimitahle resources of the deep placers, the shallow diggings, as a source of gold, will he hut of a transient character. The virtual exhaustion of the superficial gravel deposits gave origin to that prospecting for the source of gold which resulted in the discovery of the "deep placers" and the quartz veins. From these discoveries dates the inaugnration of mining as a scientific and a permanent industry in this State. The erosive power of flowing water is strikingly manifested in the stupendous denudation that has heen effected through its agency on the western slope of the Sierra Nevada mountains. In very recent geologic time the entire relief of its western slope has heen ohanged. Mountain ridges that were hundreds and indeed thousands of ft. in hight have heen utterly ohliteratod; and the present elevated position of the deep gravel channels shows how energetic has heen the operation of this element. The prevalent topographical feature of the gravel epoch have heen in many instances inverted, and that which constituted the prominences of that age have been, hy the resistless erosive power of the water, converted into the depressions of the present day. The detrital accumulations of the gravel epoch thus stand out in hold relief in the topographical features of the western slope of the Sierras, and are everywhere conspicuous objects in the panorama.

National Mining and Industrial Exposition Association.—At the annual meeting of the Board of Directors of this association in Denver, Colorado, recently, the following gentlemen were elected to serve as officers for the ensuing year: H. A. W. Tabor, President; Herman Silver, Vice-President and Auditor; O. L. Haskell, Secretary; Joseph T. Cornforth, Treasurer, and W. A. H. Loveland, General Manager. The date of opening the second annual exhibition is fixed for Tuesday, July 17, 1883, continning during the months of July, August and Septemher. It is thought that with the experience of the recent exposition a much more satisfactory one can he arranged next year. The next one will he conducted with less expense, and now that the importance of a mining exposition is recognized, a fuller list of mining exhihits may he expected. The association organized to carry on these expositions is worthy of strong support from the mining and manufacturing community.

Articles of incorporation of the National City and Cajon Valley Narrow Gauge railroad have heen filed. It is proposed to construct a narrow gauge railroad from the Cajon valley via Spring valley to National City. The road will he ahout 25 miles long. The survey has already heen made, and the work of huilding the road will he commenced immediately. It is expected to he finished in a short time, as there are no difficulties of grade, etc.

A Pillow Sham Patent Case.—John R. Adams has filed a hill of complaint in the United States Circuit Court to recover $10,000 from L. & E. Emanuel for infringement of his patent for the manufacture of pillow-sham frames and holders.

Mine Management.

Another one of those periodical experiences of mine management which occacasionally appear is attracting attention just now; hut it is peculiar in this, that a committee of the San Francisco Stock Exchange has investigated the matter and condemned the management. Last week John Thode filed a complaint in the Superior Court against the Bullion Mining company, its officers and George W. Grayson, C. F. MacDermott and the directors of the Ward Gold and Silver Mining company, in which it was averred that the Ward mine, worth $60 000, was entirely controlled hy George W. Grayson and Charles F. MacDermott; that, in April, 1880, the directors of the mine sold it to the Bullion company for $400,000 of which sum the Julia Consolidated Mining company was to pay $100,000 and the Bullion company $300,000, thereby defrauding the stockholders ont of $240,000. It was further alleged that the Bullion company gave notes for the $300,000, all of which were paid with the exception of one for $11,500, and plaintiff asked that the defendant he restrained from paying it. The complaint further charged that the salaries of the officers are extravagant, amounting to $1,550 per month; that no work has been done in the mine since January; that $870,000 has heen levied in assessments since January, 1880, and $800,000 collected; that the company owned 30,353 shares of Bullion stock, which the directors threatened to sell at a depressed price to control the election which takes place January 10th next, and the plaintiff asked that the sale he enjoined and a receiver appointed, and that the sale for delinquent assessments he enjoined. An injunction was served in accordance with this, and although an attempt was made to carry on the sale, it was postponed.

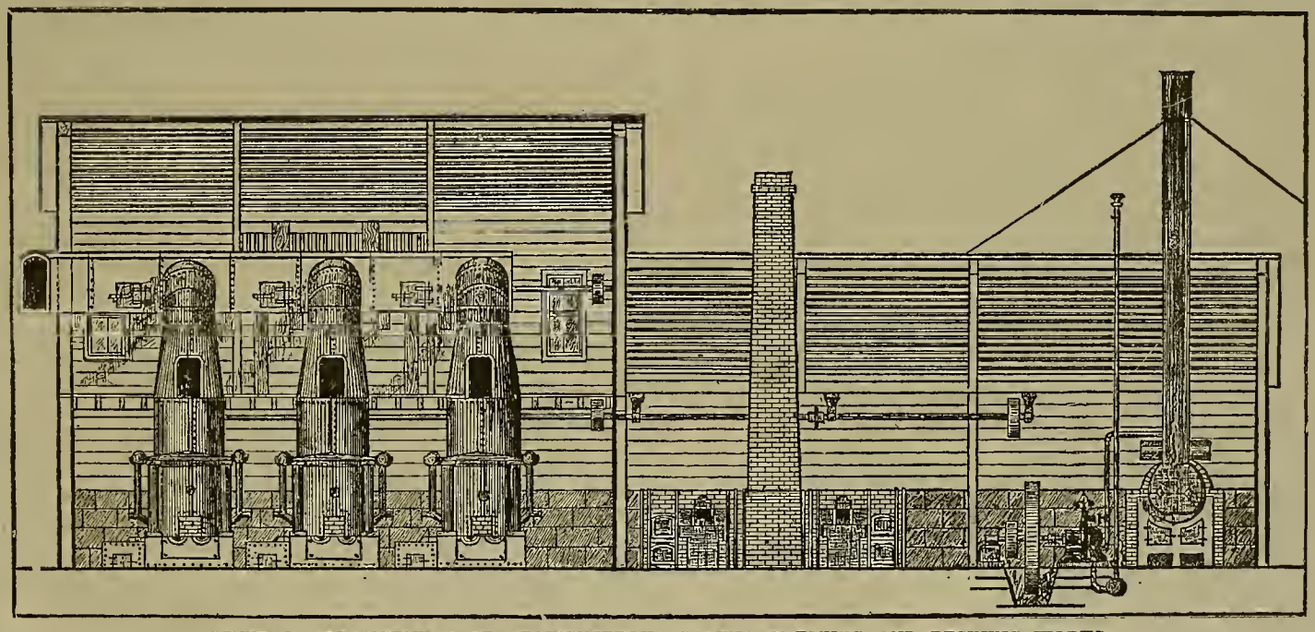
An Iron Watch.—One of the chief features of interest at a recent county exhibition in Great Britain was an iron watch which had been turned out hy Messrs. Crowther Bros. & Co., of Kidderminster, for the purpose of showing the extraordinary malleability of their metal. The watch is said to he perfect in every respect.

Large quantities of ore are heing taken out of the Home Ticket mine, the property of the Ruby-Dunderherg Company, and shipped to the Richmond furnaces.

Galena Smelting Works.

The engraving on this page represents the general arrangement of works for smelting and refining argentiferous galena, as constructed hy Rankin, Brayton & Co., of the Pacific Iron Works, of this city. The smelting furnaces have a capacity of 40 tons of ore per 24 hours each, and the cupelling or refining furnace has a capacity for handling the hullion output of these furnaces. The machinery, such as hlowers, etc., is all operated from one Wheeler antomatic cut-off engine.

The Pacific Iron Works are now making four standard sizes of these furnaces, 10, 20, 30 and 40 tons daily capacity respectively. Plants have heen furnished recently hy these works to the Philadelphia Mining Co., of Ketchum, Idaho, and the Little Wood River Mining Co., of Muldoon, Idaho, each having two 40-ton furnaces.



GENERAL ARRANGEMENT OF ARGENTIFEROUS GALENA SMELTING AND REFINING WORKS.

The following companies in Arizona are now using these furnaces: Pinal Con. Mining Co., 1 40-ton galena; Red Cloud Mining Co., 1 30-ton galena; El Plomo Mining Co., 1 20-ton galena. In New Mexico the Bonanza Mining Co. has a 40-ton galena. In old Mexico the following companies have been supplied: San Juan de Dios Mining Co., 1 20-ton galena; Plomoca Mining Co., 1 20-ton galena; Quebradilla Mining Co., 1 20-ton galena; Minas Nuevas Mining Co., 1 20-ton galena; Quintera Mining Co., 1 20-ton galena. This firm now manufactures these furnaces in New York and Chicago as well as in this city.

The arrangement, as shown, is that most usually found convenient. The Pacific Iron Works have made a specialty of this class of metallurgical appliances, and have made a great number of copper and lead smelting outfits. They were the pioneers in the water-jacket furnace manufacture here, and have continued to hold the lead in this hranch. All the improvements suggested hy long trial and experience are incorporated in the furnaces, and patents cover the principal features. As we have hefore given the details of construction of these furnaces, it is not necessary to repeat. We give the engraving merely to show mining men the general arrangement now adopted.

The Dukes of Westminster, of Northumherland, and of Southerland have accepted Vice-Presidencies of a Smoke Ahatement Institute in London. A permanent exhihition is to he maintained of smoke shating appliances.

Blackburn District, Idaho.

A correspondent of the Salt Lake *Tribune*, signing himself "Naturalist," writes from Blackburn mining district, Alturas county, Idaho, as follows:

A most wonderful discovery has been recently made on the east drainage of Little Lost river. Last July Mr. Chas. F. Blackburn, the geologist and mining explorer, came hither in search of hidden treasures. The first day after reaching his destination he noticed geological evidences highly favorable for rich mines. He started out investigating early on the morning of the 18th of July, and before noon he discovered the great "Tyndall lode." The first location was made about the center of the vein on an outcrop of gray carbonate, galena and copper. Ore samples were broken and taken to Denver. While there Mr. Blackburn had assays made of this Tyndall ore, and the results were big, the very surface ore containing from 137 to 500 ounces silver per ton. Mr. Blackburn hurried back from the Exposition, closed work on the Blackburn mine on Birch creek, and the entire camp moved hither to begin on opening of the Tyndall lode. The first thing done after arriving at the mine was to further prospect and locate extensions. The Tyndall outcrop was readily traced over 18,000 ft., contiguous throughout. The vein will average 100 ft. in width. Twelve extensions have been located, six north and six south of the original Tyndall location. Three of these show an immense crop of paying ore. The Daisy Black is a solid body of gray carbonate and galena ore, fully 60 ft. in width. Many thousands of tons of ore may be seen on the above claim.

The Ingersoll shows a solid outcrop of steel, galena, copper and chloride ore fully 30 ft. wide. The ore will average 60 per cent. lead, and from wall to wall is rich in silver. The Ingersoll shows good ore for 1,000 ft. at the surface. A mass of almost pure galena could be extracted from the mine that would exceed 20 tons in weight.

The Tyndall shows a splendid body of high-grade copper, veined with sulphurete and chloride of silver; outcrop, 40 ft. wide. Character of ore: Galenite, tetrahedrite (or gray copper), carbonate and oxide of copper and carbonate of lead in abundance. Through the above is mingled sulphurets and chloride of silver, making the Tyndall a rich ore in the latter metal.

The Daisy Black, Ingersoll and Tyndall are all full claims of 1,500 ft. each, and all veritable bonanzas.

The Alice extension shows splendid croppings, 50 ft. wide, of gray carbonate ore. The Daisy B. is owned by W. P. Black & Jenkins Bros., Denver. The Ingersoll and Tyndall are owned by Chas. T. Blackburn & O. C. Johnson. Blackburn's interest cannot be bought for a million dollars. The Daisy Black shows up several hundred thousand tons of good ore. Its value cannot be approximately estimated. Besides the bonanzas the following extensions show a well-defined vein of leached croppings: The Northern Crown, War Eagle, Silver Bow, Carbonate Queen, Combination Dixie and Silver Queen. The outcrop or surface of the above extensions is mostly leached ore. However, specks and streaks of carbonate, copper and chloride visible in the ore is a pretty fair criterion of these caps being merely a superficial covering of "subterranean bonanzas." The pick and drill will soon open shafts and tunnels to the "Tyndall vaults," and I predict a flow of bullion rivaling all the mines of the northwestern country. This great mine was named by its discoverer, Mr. Blackburn, in honor of Prof. John Tyndall, the scientist. Tyndall is situated in a quartzite formation, evidently of "eozoic age." A formation underlies the quartzite in this section; it is a metamorphosed mica slate, and of "azoic age," the oldest rock here found. The remaining country rock is limestone of "silurian and devonian age." The adjoining country has undergone volcanic disturbance on a grand scale. Nature has left us the effects of her wonderful work—she produced a mine of fabulous wealth. The value of the Tyndall cannot be estimated by present man, nor does the writer venture a good description of so great a mine. The trend of the Tyndall is due north and south. Some of the outcrop stands vertical; other parts dip east about 45 degrees. The lode is a true fissure vein, going down through the axis of the range. The outcrop of the Tyndall rivals any mine in the United States. It is yet to be proved, but there is reason to believe, from material evidence, that explorations will show the "Tyndall" to be one of the greatest mines ever discovered. Think of a vein five miles long; think of a body of ore at places over 60 ft. wide, 60 per cent. metallic lead, hundreds of ounces of silver in every ton of ore; think of this fact; but if still skeptical, I can only extend an invitation to come and see, and then dream of wild cats and millionaires, and after that you will conclude that the Tyndall is a genuine bonanza, and as deep as the "Professor" himself. Altitude of the outcrop of the Tyndall is about 7,500 ft. Plenty of water at the mine. The country is level between the mine and the U. & N. R. R., a distance of 50 miles. Water rights and mill sites have been located, and reduction works will be constructed early next season.

The development of this mine is bound to prove a financial success. Failure is practically a geological impossibility, as there are now hundreds of thousands of tons of paying ore visible—all shown by dame Nature herself.

The Mechanical Properties of Aluminium.

Having had occasion to use aluminium in the construction of instruments adapted for special purposes, and having observed that it possessed a remarkable degree of strength in proportion to its weight, and a large range of elastic action, it appeared to me desirable to ascertain more fully the mechanical properties of this metal. With this object, a bar of aluminium, three feet long and one-fourth inch square, was obtained, and different parts of this bar were subjected to test for tension, compression, transverse strain, and also to ascertain the modulus of elasticity, the elastic range and ductility. The experiments were carefully carried out for me under the direction of Professor Kennedy, with his testing machine, at the London University, and the results are given in the table appended to this paper.

It will be seen, on reference to the results obtained, that the weight of a cubic inch is .0972 pounds, showing a specific gravity of 2688, and that its ultimate tensile strength is about 12 tons per square inch. The range of elasticity is large, the extension at the yielding point being 1-200 part of its length. The modulus of elasticity is 10,000. The ductility of samples, two inches long, was only 2·5 per cent., but it is probable that the metal could be improved in this respect. Taking the tensile strength of this metal, in relation to its weight, it shows a high mechanical value. Its characteristics in this respect, as compared with those of other well known metals, are shown in the following summary:

	Weight of a cubic foot in pounds.	Tensile strength p. sq. inch in lbs.	Length of bar just capable of bearing its own weight.
Cast-iron	444	16,500	5,351
Bronze	525	36,000	9,893
Wrought-iron	480	50,000	15,000
Steel of 35 tons per inch	490	78 000	23,040
Aluminium	168	26,880	23,040

It thus appears that, taking the strength of aluminium in relation to its weight, it possesses a mechanical value about equal to steel of 35 tons per inch.

Aluminium is, unfortunately, a very expensive metal, and although an increased demand might lead to a considerable reduction in price, yet the process by which it is extracted leaves little hope at present of obtaining it at a rate sufficiently low for general use. But its mechanical properties point to its suitability for those cases where strength, combined with lightness and a great range of elastic action are required. The elastic range is about three times that of steel, and about five times that of wrought iron.

In the discussion Sir H. Bessemer said that experiments had been made and others were in hand by which it was expected to obtain a new process which would very greatly reduce the cost of manufacture. He also produced a door key made in aluminium, stating that 40 of such keys would only weigh one pound.

It may be added that Sir Wm. Thompson uses aluminium for the rims of his very excellent compass for ships.—*W. H. Barlow, in London Mining Journal.*

Concentration.

Method for Working Low-Grade Ore.

Supt. Foulke has for several weeks been experimenting with two of Frue's concentrators at the Star mill. We took a walk up to the mill a day or two ago and found these machines running smoothly and in perfect order. Five stamps are used to crush the pulp that feeds them, and, of course, the poorest grade of ore is selected for these stamps. By this method of concentration $25-ore is worked to a profit, 75% being realized from its assay value. No. 30 screens were at first employed on the concentrators, but a gradual grading down showed improved results, until now a No. 16 is in use, and Mr. Foulke thinks a No. 12 or 14 will be an improvement even on that. The result of the experiments so far has been entirely satisfactory, and Mr. Foulke believes that this process will prove the salvation of his company, and cannot fail to work wonders for all districts whose mines carry large quantities of low-grade ore that cannot be worked at a profit under the old milling system. Another very important item resulting from the work of the concentrators is that the grade of the bullion produced is much finer. The Star bars have improved in grade from 470 to over 600 since the new system has been in operation. It also saves much labor in handling and sorting ore, the services of seven men in this capacity having already been dispensed with at the Star.

If this system of concentration can successfully be applied to all the ores of this district—and there appears no reason why it cannot—we may confidently look for three or four companies operating here in the not distant future. There are thousands of tons of low-grade ore here that only await some cheap process for profitable reduction. We shall watch with interest the Star company's progress with Frue's concentrators and from time to time note the result. If it proves as successful as its owners predict it will surely cause a revolution in the industry of hundreds of now almost deserted camps in Nevada, and place those that are struggling against heavy odds for existence on the high road to prosperity.—*White Pine News.*

Demand for Mines.

The Butte (Montana) *Miner* says: The fact is becoming more and more apparent that the demand for meritorious mining properties is on the increase. A few days ago this office received a note from a gentleman in California, in which he requested to be put in communication with some party or parties who had a copper mine for sale. These inquiries, which are becoming quite common, argue that the owner of a lode has only to put it on a paying basis to secure a purchaser at figures which will amply repay all his toil and expense in reaching that stage. Quite recently the famous Drum Lumon lode in Lewis and Clarke county found a purchaser at the snug sum of $1,500,000. A few years ago that mine was not known outside of its immediate neighborhood, but its owner, who was then without means, kept constantly at work in its development and is now reaping the fruits of his industry and perseverance.

At no time in the history of this country has there been so great a degree of national prosperity or so much capital seeking investment as at present. This leads to inquiries from syndicates and men of capital for well-developed mines in shape to produce substantial results. When they are brought to this condition purchasers are readily found. We are aware that the men who take their prospecting outfits and dig and delve in the waste places in the mountains are generally poor, frequently penniless, and in most cases wholly dependent upon those who back them for the scant supplies they carry. Unless the lode when discovered pays from the grass roots down the product from sinking the shaft falls short of the attendant cost. And until depth be attained from which levels may be run little or no profits may be realized from the small amount of ore obtained.

Now, penniless men cannot meet the expense necessary to put a mine in paying shape, and unless some one comes to their assistance with means, the work has to be abandoned very soon after the discovery is made. There seems to be only one way to meet this difficulty, and that is by men pooling their discoveries and concentrating their little means and their whole labor upon their most promising prospect, and when the developments prove they have a mine, there will be no lack of purchasers. Under the almost universal practice followed by Western miners, of simply representing their lodes under the law, we find in every district scores of lodes lying idle, and consequently unproductive, awaiting the advent of purchasers. It is an unprofitable business. Money loves a warm nest, and where it can find a place to stow itself away where there is a prospect of finding congenial company it does so. But it avoids unproductive places, and the most unprofitable, as well as the most unsatisfactory place it can get, is an idle mine. There is no reason why so many of them are found. Labor is capital, and its concentration upon a few now undeveloped lodes would affect their sale and put life and spirit into scores of now almost deserted mining camps, for there is a demand for good mines.

Molecular Structure of Metals.

It is generally held that although most of the known metals are crystalline, they cease to be so when in a rolled state. Whether this be strictly true or not has never been put to the test, but recent experiments by M. S. Kalischer prove that foils of the metals can be made crystalline under the influence of heat. One result of the change is an increase of their electric conductivity. Non-chrystalline zinc foil becomes crystalline at a temperature of 150° Cent. Tin and cadmium foils become crystalline at temperatures ranging from 200° to 280° Cent. Iron and copper show traces of chrystalline structure when left in contact with nitric of hydrochloric acid, but the best result is obtained when the plates are made the positive electrode for the electrolysis of potassium or copper sulphate of nitrate. Specimens of brass containing 36% to 66% of copper showed a crystalline structure when made the positive electrode of solutions of copper sulphate or nitrate. In these cases the electric current does not, in M. Kalischer's opinion, produce the chrystalline state, but rather the solvent power of the electro-negative constituent of the electrolyte, for it is observed that metals which do not show any crystalline apperance when corroded by free acids or solutions of salts do not show it under the influence of the electro current. Lead foil is crystalline; silver foil becomes so when heated red hot; gold foil exhibits a crystalline structure when heated and then acted upon with warm aqua regia. Platinum, as was observed by Phipson, becomes a chrystalline when warmed with aqua regia. Bars of copper, brass, steel, bronze, tin, zinc and cadmium have been carefully observed by M. Kalischer, and shown to have a crystalline structure.—*Engineering.*

VAPOR OF TOBACCO JUICE.—By vaporizing two quartz of tobacco juice over a slow fire, Baron Rothschild's gardener, at Paris, Monsieur Bozard, destroys all the troublesome insects that may be contained in the hot house in which the operation is performed. He considers the remedy infallible, and says it rarely injures the tenderest plants.

THE steal trade is likely to revive considerably about midnight of the 31st of the present month. Location notices may be written on the ground, as there will be a full moon.—*New Mexico Pointers.*

Water Power for the Idaho Mine.

The Idaho Mining Company, says the Grass Valley *Union*, has definitely decided to use water power at their mine for milling and hoisting purposes, and have contracted with the South Yuba Water Company to receive 350 inches of water from the new ditch that that company is now constructing from Quaker Hill down to Town Talk. This ditch will have a carrying capacity of 1500 inches, and a branch of it will be carried along the range of hills on the east side of Wolf creek to a point near Mock's ranch which will be about 500 ft. higher than the Idaho works; and from thence the water will be conveyed to the works, a distance of 8,000 ft. in 22 inch iron pipe. A portion of this pipe has already been purchased and will soon commence to arrive from below, and the remainder will be made upon the ground. It is the intention when this water is brought in to do all the hoisting and milling by water, and from the estimates which have been made the company expect to make an annual saving in the cost of power of at least $20,000, without estimating a return from the water which may be sold for other purposes after passing the company's works. The whole cost of the improvement is estimated at $40,000, and from the prospect that the mine gives of profitable working for a number of years to come, the saving in running expenses will prove a very important item. After water power is introduced the present steam machinery will be kept in place to provide against any contingencies in the way of breakage in the ditches and reservoirs or snow obstructions in winter. The introduction of water to the Idaho will not only be an economical feature for that mine, but the same water can be used by other mining companies lower down the creek, and altogether the effect will be to lessen the cost of milling in the district, and in that respect be an incentive to prospecting. The use of water will materially lessen expenses by a saving of steam machinery, the cost of fuel and in labor, and ought to bring the milling below one dollar per ton. It is said that the Providence Mining Company, on Deer creek, since running their mill by water, is enabled to crush quartz at 50 cents per ton, which, if correct, shows that a great reduction can be made upon the cost of steam power, and that very low grade rock can be worked to a profit. But if by the use of water quartz can be worked at any figure below one dollar per ton it will be considerably below the present cost of milling in this district. Although the work upon the ditch that will convey water to the Idaho is being rapidly pushed forward, the lateness of the season makes it almost certain that there will be interruption by bad weather, and it is not contemplated that the Idaho works can be run by water power before next May or June.

Campbell Process.

In speaking of matters at Idaho Springs, Colorado, the Denver *Tribune* says: The new building in course of erection for the Campbell process of treating ores is advancing rapidly under the supervision of Mr. George V. Northey, who is the general manager for the company owning this process. It is located on the site of the old Star mill, where several processes have been tried, and, phœnix-like, others have sprung from their ashes. A number of months ago Col. F. F. Oshiston shipped several carloads of Fresland ore to the Pacific slope, and had it treated by the process in question, under conditions that left no doubt of its successful application to the ores of this region. Acting upon this experiment, Col. Oshiston has interested himself in the enterprise under consideration, and his long experience in mining and milling are a sufficient guarantee to the public of the feasibility and success of the undertaking. The objects that first strike one as being novel in this section are two cylinders of sheet iron lined with brick and reaching from the basement to the top of the building, a hight of about 40 ft. One of these is three feet, and the other four and a half feet in diameter. The largest of these is the desulphurizing furnace, while the smaller one carries off the waste products of combustion. The washing is accomplished by ignited jets of crude petroleum introduced by Parson & Northey's hydro-carbon injector. The capacity of the works will be about 40 tons of ore per day, and it is claimed that the most refractory ores can be successfully treated; indeed, the process seems to be specially adapted for ores of this class. Ninety-five per cent of the assay value of the mineral can be extracted. The object is to take the low grade ores of the district and convert them into smelting ores. A boiler of 50 and an engine of 30-horse power will run the crushing machine.

NEVADA MANUFACTURERS.—A recent census statistical bulletin sets forth that in the State of Nevada there are 184 manufacturing establishments, employing an aggregate of $1,323,400. The average number of hands employed is represented by 555 males above 16 years of age, 5 females above 15 years and 16 children and youth. The total amount paid in wages during the year was $461,807; the value of materials, $1,049,794, and the value of products, $2,279,736.

RYOLITE, crushed into fine sand, is being used at the Richmond new furnaces in the foundation to prevent the molten lead from penetrating it. The lead chills, and therefore stops running as soon as it strikes the sand.

MECHANICAL PROGRESS.

Steel for Nail Making.

A most important and unexpected event has grown out of the late iron puddlers' strike at Wheeling, Va. Rather than comply with the demands of the strikers, the iron men have resolved upon a course which bids fair to effect a most important revolution in the iron business and to utterly do away with the common iron nail and introduce in its stead nails made from soft, tough steel. Hitherto nails have been made altogether from hand-puddled iron, but for some time past experiments have been quietly going on to test the value, cost and practicability of steels nails.

One of the leading nail manufacturers of Wheeling—in which city nearly one-half of all the nails used in the country are made—has been quietly, from time to time, placing in the hands of his workmen nail plates of soft steel which they did not distinguish from the ordinary nail plates, and these steel plates have been made into nails without the workmen or the public being aware of the fact. The results of these experiments have been so complete and the nails have given such decided satisfaction that it has been decided by all the principal nail manufacturers to adopt the steel nail. Secrecy was necessary, because there has ever been a great disinclination on the part of carpenters and contractors to use steel nails and a similar disinclination on the part of the nail men in the factories, for the reason that the Bessemer steel process, if generally adopted by the manufacturers, would throw fully 4 000 puddlers out of employment in the single city of Wheeling.

The recent strike of the puddlers has simply precipitated a movement which would have been brought about, under any circumstances, sooner or later. There can now be little doubt but that the days of the iron nail have been numbered, and prejudice will no longer stand in the way of a greatly needed improvement in the progress of an important manufacture. When the steel nail comes into general use the public will see and recognize its superiority and will have no other.

The Wheeling manufacturers have formed a syndicate, into which nearly all have entered, with an unlimited amount of capital. The steel plates will all be made at one Bessemer converting establishment, so that the nails produced will be uniform in character. Ground will be broke for the new converting works January 1, 1883. They will have a capacity to start with of 500,000 tons per year of low carbon steel. This output the syndicate will divide up into consignments according to the capacity of different nail mills represented in the syndicate, and each will get its allotment of so many carloads of steel rail plate per day from the Bessemer mill.

Several attempts have been made in past years to introduce steel as a material for nails. At one time an establishment was started at Troy, N. Y., but either for the reasons stated above or from some other cause the project had to be abandoned.

The writer chanced to be at the large nail works just as they were being started up at Pueblo, Col., some three months since. Observing that puddling furnaces were in operation for making nail iron, immediately adjoining the Bessemer works at that establishment, we inquired why they did not employ steel for their nail plates instead of iron, as with the facilities and appliances there the steel would be nearly or quite as cheap as iron. The reply of the manager of the works was to the effect that, although they knew steel was about as cheap and made a much better nail, it was impossible to overcome the prejudice against steel nails—hence they had fitted up their works with puddling furnaces. The united determination of the Wheeling manufacturers will undoubtedly break down this senseless prejudice.

Pittsburg is also following in the wake of Wheeling in this respect, and has already a company, with $750,000 capital, organized to manufacture nails of Bessemer steel. The Pittsburg company will start before the factories in Wheeling are ready. The steel article is stiffer and tougher than the iron nail, and so much lighter that the added cost per pound will be more than balanced by the increased number of nails in a keg.

THE EFFECT OF MACHINERY ON COAL PRODUCTION.—The cost of coal production has been wonderfully cheapened of late by invention. A carload of coal is mined, loaded, hoisted, screened and cleaned in half the time that was required for the process ten years ago, and this product will doubtless be still further materially cheapened by improvements yet to be made in machinery for mining and handling coal.

FINISHING SAWS.—A late improvement consists in tempering and straightening the saws at one operation. This is done by heating the saws to the proper degree, and then pressing them with a sudden and powerful stroke between two surfaces of cold iron. A drop press is employed for the purpose. The mechanism is quite simple and inexpensive. Its use effects an important economy in the manufacture of nearly all kinds of saws, and also improves their quality.

Absorption of Moisture by Building Materials.

Everyone connected with buildings of brick and stone knows the absorbent nature of those materials under the most favorable circumstances. It would astonish most people, adds the *Building News* (London) to be told what a large quantity of water is stored in the brick walls of an ordinary house after a heavy rainfall, the drying or evaporation of which must take place inside in cold weather, unless proper precautions are taken to render the walls impenetrable. The plea for hollow walls has been raised again and again in this journal, and though the system is coming to be adopted more generally in some districts, the idea of solidity of wall structure seems to have taken too deep a hold on the ordinary building mind to be given up. Some time ago a suggestion was made that colliery owners and others who have large quantities of slag might with profit utilize this material for building cottages and other purposes. We are not sure whether the hint was taken, but in some parts of the country the material furnishes an admirable aggregate for concrete. Where good aggregates exist like slag, broken brick, sandstone or furnace ashes, concrete building ought to be much cheaper than brick, as no skilled labor is required.

There is another consideration besides cost which tells in favor of concrete, and that is the non-porosity of walls so constructed. Not only does brick absorb moisture in wet weather, but it is now known to absorb animal gases as well, and here we have a condition which builders of our hospitals and infirmaries ought to be reminded of. We are not sure if concrete has been applied to any buildings in England of this kind on a large scale, but as absorbent walls are known to be injurious in harboring the germs of infection, the value of walls constructed of concrete made of burnt aggregates cannot be overrated. Slag-made concrete has the great advantage of being fire resisting, the material in its rough state having been subjected to intense heat. There is nothing in it to "kill" the cement, and the rough surface of walls built with it becomes an excellent "key" for the plastering. In the constructions of walls of this material three sizes of the slag may be used, the larger lumps being packed in layers in the middle of the wall, and the other two sizes, the larger of the size of walnuts, run in with cement on each face in the proportion of eight to one.

STOPPING ENGINES BY ELECTRICITY.—A method for stopping steam engines by the electric current in case of a break-down of machinery or other accident in factories, or in the event of an impending collision on board steamships, has been devised by Mr. Tate, manager of some large woolen mills in Bradford, England. The apparatus consists mainly of a weighted suspension rod, an ordinary Leclanche battery, an electro-magnet and conducting wires leading to any number of points from which it is desired the engine shall be controlled. The electro-magnet is placed in a small box at the top of the stopping apparatus, which is connected with the stop-valve of the engine. Should an accident occur to the machinery in any part of the factory where the electric push is fixed, upon the button's being pressed and contact made the electro-magnet acts upon a lever, which releases the weighted suspension rod. This rod instantly descends by gravity, and in its descent it opens a three-way cock, by which means steam is admitted from the boiler to a cylinder containing a piston, which latter is raised, and, in rising, closes the stop-valve and shuts off the steam. In like manner the captain of a steamship can, from the bridge, stop the engine of his vessel instantly should he see danger imminent, thus avoiding the delay incidental to the giving of a signal to the engineer and the risk of that signal being misunderstood in the moment of peril.

THE UTILIZATION OF SMOKE.—A company at Elk Rapids, Mich., which manufactures 50 tons of charcoal iron a day, formerly allowed the smoke made in burning the coal to go to waste. Now the smoke as it is formed is delivered into stills charged with lime and surrounded by cold water, the result of the condensation being, first, acetate of lime; second, alcohol; third, tar; the fourth part produces gas, which is consumed under the boilers. A thousand cords of wood are converted into charcoal daily, yielding 2,800,000 cubic ft. of smoke, from which are obtained 12,000 lbs. of acetate of lime, 200 gallons of alcohol and 25 lbs. of tar. The alcohol has been contracted to a firm in Buffalo, N. Y., the *Trade Review* says, for five years, they furnishing the packages and receiving it at the works at 80 cents per gallon. The gases usually wasted when iron is produced with stone coal or coke are now, in some European establishments, made to give up the tar, ammonia, etc., which they contain. *Engineering* reports that this is effected at the Gartsherrie works without disturbing the smelting process and without materially lessening the value of the gases for heating boilers and similar work. A similar process has lately been introduced in the coke trade of South Durham and at some of the coking collieries of France, the waste gases being used in the production of commercial ammonia.

SCIENTIFIC PROGRESS.

Oscillation of Land in the Glacial Period

In the *Geological Magazine* for September and October Mr. T. F. Jamieson discusses the question of the origin of the changes of level in the Glacial and following era. He shows, by reference to facts from Great Britain and Europe, that they cannot be accounted for by any theory, including Croll's, which makes them simply a change in water level. He states, in opposition to the view sustained recently by Dr. Penck, of Munich, that the local attraction of the ice was sufficient to cause a large submergence of coast regions, and different for different localities, according to the bight and position of the ice, the following facts: That shell beds near Dublin are 1,200 feet above the sea, and "it is difficult to see where the mass of ice or land could have existed in Ireland to have exerted the requisite attractive force;" that there are "shell beds in Wales at 1,350 feet, and no evidence of submergence in the valley of the Thames, only 200 miles off; and that there are subsidences of land over the interior of continents that cannot be thus explained. He further adds:

"Colonel Clark, in his recent treatise on Geodesy, says that although mathematical calculation shows us that large tracts of country may produce great disturbances of the sea-level, it is at least questionable whether in point of fact they do. The attraction of the Himalayas as deflecting the plumb line at various places in India has been computed, and it has been found that there is little correspondence between theory and observation, for the attraction of the Himalayas only makes itself perceptible to observation at places quite close to them.

"An examination of the tables given by Mr. Buchan in the Transactions of the Royal Society of Edinburgh, showing the mean hight of the barometer in various parts of the world, leads me to think that the supposed influence of the continents and high masses of land in drawing the ocean toward them has been greatly overestimated by the authors to whom Dr. Penck appeals; for these tables certainly lend no countenance to the notion that the sea-level is subject to the great inequalities of levels which he assumes."

Mr. Jamieson adopts the opinion, and argues for it at length, that the subsidence was due to the weight of the superincumbent ice, the effect of which would be slowly produced and slowly and often only partly recovered from.

The following postscript in regard to the subsidence of the Andes may be read with interest in connect on with the above:

One of the foreign journals presents a singular statement in regard to diminished altitudes—the Andes, it appears, showing a sensible decline. According to this statement, Quito was found by La Condamine, in 1745 to be 9,596 feet above the sea; Humboldt, in 1803, could only make 9,570 feet of it, or 26 feet less; Boussingault, in 1831, was surprised to find the measurement show only 9,567 feet; Orton, in 1867, found it reduced to 9,520 feet; and Reuss and Stubel ascertained as late as 1870 that it had actually shrank to 9,356 feet. Quito, it seems, had sunk 246 feet in 125 years, and Pichincha 218 feet in the same period. The remarkable fact appears, from definite determinations, that its crater has sunk not less than 425 feet during the last 26 years, and Autisana 165 feet in 64 years.

Causes of Dry Zones.

Professor Marsh, at the last Montreal meeting of the American Association for the Advancement of Science, presented a paper from Prof. Guyot on the subject of "Dry Zones," and offered an explanation of the causes of dry zones in both hemispheres which Prof. Loomis had described. The zones were found in the sub-tropical regions, where the rainfall is usually greatest.

The first of these zones appears very generally around the globe between the 23° and 30° of north latitude, beginning in Southern California and continuing in Sahara, Arabia, Afghanistan and across a portion of the Malay peninsula. The second zone he marked on the southern hemisphere, beginning in Peru, appearing again in the Argentine Republic, and again noticeable in South Africa to the north of the Hottentot country, and then in the northern section of Australia.

The cause of these dry zones Prof. Guyot finds in the fact that on the regions in question during the continued dry seasons there is a "descending wind." The counter currents from southwest and northeast cause an ascension of the air at the equator, and these waves, as they may be called, descending again, take up the heat lost in the altitude and are subjected to such a pressure that they give up none of the moisture they contain. This accounts for the fact that although these waves are frequently cloud-laden, there is no precipitation.

A discussion of the paper followed, in which Prof. Hunt, of Montreal, Prof. Brown and Prof. Newberry gave isolated facts within their personal experience which tended to strengthen the views advanced by Prof. Guyot.

Transmission of Power on an Ordinary Telegraph Wire.

M. M. Deprez says in a late number of *Comptes Rendus:* "The Electrotechnical Committee of the Exhibition of Electricity at Munich having requested me to repeat upon a telegraph line the experiments on the transmission of power which I had previously made over great distances, I forwarded to Munich and Missbach the line wire machines which I had made use of in my laboratory experiments.

The telegraph line placed at my disposal by the administration of the German telegraphic system had a length of 57 kilometers. It is of galvanized wire 4 5 millimeters in diameter, and since, as a matter of precaution, I did not think fit to make use of the earth, I requested permission to employ a return wire identical with the former. The total length of the line traversed by the current is, therefore, 114 kilometers, and its resistance on measurement 950 ohms. The insulation is good, but differs in nothing from that universally employed on all telegraph lines. The two machines situate the one at Miesbach and the other at Munich, are absolutely identical, and have each a resistance of 470 ohms.

The total resistance of the circuit is, therefore, close upon 1,900 ohms. In the first experiment which was made there was immediately obtained at Munich a work of 38 kilogrammeters per second (or about one-half horse power) at a speed of 1,500 revolutions per minute.

The generating machine, situate at Miesbach, turned at the rate of 2 200. The two machines being identical, the proportion of the work recovered at Munich to the work expended at Miesbach was, setting aside passive resistance of every kind, 1500 2200, or more than 60 per cent. The machines employed are of Gramme's "atelier" type, modified according to my calculations.

A heavy rain fell during almost the whole of the experiments.

The receiving machine serves at present to feed a water-fall of one meter in width and three in hight, by means of a centrifugal pump.

Sparks are scarcely visible on the collectors of the two machines. The heating of the machine is scarcely appreciable after two hours' work.

What is the Comet Made of?

MM. Thollon and Gouy have communicated to the French Academy of Sciences their results of their spectroscopic observations on the large comet now visible. It appears from these, says *Engineering*, that at the observatory of Nice, on the 18th of September, they detected very brilliant rays of sodium, which were slightly displaced toward the red.

On the 9th of October the sodium lines had disappeared, leaving only four ordinary bands of carbon, of which the violet band was very distinct, but feeble, while the others were bright, especially in the head. This gave at the same time a continuous spectrum, in which could be seen a great number of black and bright rays.

On the 16th of October the spectrum was much the same, except that the violet band had almost disappeared, and the continuous spectrum had become feebler. The spectrum, in fact, showed a striking resemblance to that of the flame of alcohol. Of course this does not imply that alcohol is present in the comet, since it is known that all compounds of carbon give the same bands, and of these alcohol was only chosen because it was most convenient for comparison.

The "integral spectrum," taken by a direct vision spectroscope, showed that the major portion of the comet's light was white, and probably reflected sunlight. The vanishment of the sodium lines and other brilliant rays would seem to prove that the spectroscope cannot give a complete analysis of cometary matter. It is probable that this matter is similar to that of acrolites, and if the temperature of the comet is sufficient to produce an emission spectrum from the compounds of carbon, it ought also to give a spectrum of sodium; but this, as found by MM. Thollon and Gouy, is not always the case.

They are, therefore, led back to the electric theory of comets. It is known that if a carbureted gas is traversed by the electric discharge from a Holtz machine deprived of condensors, the gas kindles and gives the carbon bands; and if it hold metal dust in suspension, it will give the bands without showing the lines of the metals. Something of the same kind possibly takes place in comets.

ELECTRICAL PHENOMENA ON PIKE'S PEAK.—A gentleman writing from Pike's Peak, under date of October 25th, says: "Many who have strong lungs remain purposely all night to witness the electric and stellar lights, which are sometimes very fine. One night last summer an electric storm came on, which, from the description given me by Officer Leitzell, must have been very grand. For two days previously thunderstorms had been rolling among the mountains, and then for over two hours everything was tipped and covered with electricity. Spanish pack-mules, left on the summit for the night, appeared to be all on fire; the clothes of the men seemed ablaze—electricity streamed from the tips of the fingers, from the nose and from the hair. The anemometer, on top of the building, spat fire at every revolution. Every rock on the summit was covered with flame."

Mining Share Market.

Mining stocks appear to have got down about as low as possible, since if they go a great deal lower there will not be much left of them to sell. The cause for the low prices is doubtless lack of faith in the "securities" and the scarcity of bonanzas.

Active operations have again been resumed at the Savage and Hale and Norcross mines. A joint drift is being run on the 2600 level, from which the two companies will run out into and explore their ground. The Chollar folks are pushing their south drift toward the Potosi line. The ground is becoming softer and more promising, and it is the belief of many mining men that ore will be found down near the Potosi line. The *Enterprise* says: It would not take a very hig development to put a good deal of money into the pockets of those who have bought during the late and prevailing depression. It will not be long before something will occur in the drifts now being run in the middle mines, in the Sierra Nevada crosscuts, the crosscuts about to be started in the Mexican and Union, or at the bottom of the Ophir-Mexican Winze on the 3100 level, that will give things a different look. Then the man who bought stocks at a time when no one wanted them will be in a position to make a fair profit by selling to those who never feel like coming in until about the time when he (the cool man) is thinking of going out.

SAVING STAKES.—During the past few months the miners of the Comstock have formed a sort of mutual insurance society. A number of men enter into an agreement by which if one man is discharged the rest make up a purse of $10 a week and pay him until he gets on again. Sometimes two men agree that when one is discharged the other shall pay him ten a week as long as he is idle.

PENDING the action of Congress on the reduction of the tobacco tax, the tobacco trade of the country is in a very unsettled state, and manufacturers will suffer severely unless something is done speedily.

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superior Court, Department No. 10, San Francisco:

Electric Supply Co., Dec. 18. Object, to manufacture and deal in electrical supplies, electric signals and philosophical apparatus, and operating and repairing the same. Trustees: W. C. Pease, E. C. Pease, Robert Langer, Orion Brooks and F. R. Weigle. Capital stock, $60,000, in shares of $10 each.

Inventors' Institute of California, Dec. 16. Directors: N. W. Spaulding, Edward P. Fliut, Daniel C. Hayes, Columbus Watorhouse and Ira P. Rankin. Capital stock, $5,000.

California Fire Apparatus Manufacturing Co., Dec. 20. Object, to manufacture and sell the "Climax" chemical fire extinguisher, chemical steam and hand fire engines, hook-and-ladder trucks, and do a general machine shop business. Directors: A. F. Shawn, Joseph L. Tharp, H. J. Campbell, Louis Vesaria, Wm. K. Friend and F. K. Clark. Capital stock, $50,000.

Antelope M. and M. Co., Dec. 20. Location, Cochise mining district, Cochiee Co., A. T. Directors: Alexander Badlam, E. H. Fritch, Joseph W. Williams, W. P. Coleman, E. B. Badlam, E. H. McMillan and W. N. Wash. Capital stock, $4,000,000, in shares of $20 each.

Guadalupe M. Co., Dec. 18. Location, Lower California. Directors: Hugh McCormick, George H. Dana, J. P. Manrow, D. P. Drexler and Homer S. King, all of this city. Capital stock, $50,000.

Recent Contributions to the California State Mining Bureau.

[Furnished for publication in the MINING AND SCIENTIFIC PRESS by HENRY G. HANKS, State Mineralogist.]

[CATALOGUE.]

4393. Seeds from the Pochote tree—(No. 4392) Noel Marrigotte.

4394. Silk from the Pochote tree—(No. 4392) Noel Marrigotte.

4395. Opals—Stockton Hill, Mokelumne Hill, Calaveras county, Cal. James Osborn. When this locality was first discovered, many years ago, the opals were thought to be of great value, and considerable capital and labor were extended to prove them worthless.

4396. Glass tube containing the products, natural and artificial, of the Sulphur Bank quicksilver mine, Lake county, Cal. H. M. Caldwell.

4397. Ore from the Mammoth mine, Baker county, Oregon, 11 ft. from footwall. John Leary.

4398. Ore from the Mammoth mine, Baker county, Oregon, 90 ft. from the northwest corner. This specimen is rich in copper. John Leary.

4399 Rich copper ore from the Mammoth mine, Baker county, Oregon, 38 ft. southeast of the Monument. John Leary.

4400. Erubescite from the Mammoth mine, Baker county, Oregon. John Leary.

4401. Silver Ore Mina el Hambre—Manizales, Antioqua, United States of Colombia. Carlos Faulhaber.

4402. Silver Ore, Mina Maruianda—Manizales, Antioqua, United States of Colombia. Carlos Faulhaber.

4403. Silver Ore, Mina Canada—Manizales, Antioqua, United States of Colombia. Carlos Faulhaber.

4404. Alum (?)—Near Newhall, Los Angeles county, Cal. N. Wynants.

4405. Pyritic ores, claimed to be rich in gold—Chile. F. Casaneneva.

4406. So called White Lava; probably indurated volcanic ash—S. P. R. R., Los Angeles county, Cal. Charles. W. Brown.

4407. Helix—Sp (?)—County Antrim, Ireland. Dudley C. Stone.

4408. Unio Patulus (Lea.)—Ohio.

4409. Unio Phaseolus (Hild.)—White River, Indiana.

4410. Unio Bigbyensis (Lea.)—Georgia.

4411. Unio Crassatus (Lea.)—Georgia.

4412. Unio Ouuculus (Lea.)—Tennessee.

4413. Unio Decisus (Lea.)—Alabama river.

4414. Unio Fulvus (Lea.)—South Carolina.

4415. Piece of a wooden pile bored by the Teredo Navalis. J. Z. Davis.

4416. Unio Metastritus (Con.), female—North Alabama

4417. Unio Palelloides (Lea)—Clinch river, Tennessee.

4418. Margaritina Complanta (Bar.)—Ohio river.

4419. Unio Mardiensis (Lea.)—Tigris river, Assyria.

4420. Mallcus Vulgaris—Australian seas. J. Z. Davis.

4421. Conus Litteratus (Lin.)—Japan.

4422. Harpa Articularis (Lam.)—Japan.

4423. Pteroceras Lambis (Lin.)—Japan.

4424. Ricinular Tuberculata—Japan.

4425. Mytilus Sp. (?)—Hong Kong, China.

4426. Trochus Acutus—Nagasaki, Japan.

4427. Mytilus Dunkeri—Nagasaki, Japan.

4428. Voluta Vespertilio (Lin.)—Japan.

4429. Pyrula Tuber (Gmelin)—Japan.

4430. Eburna Sp. (?)—Japan.

4431. Trochus Nigricolor—Japan.

4432. Solen siliqua (Lin.)—Japan.

4433. Conus Betulinus (Lin.)—Japan.

4434. Mya Arenaria—Japan.

4435. Solen Ambigua (Lam.)—Japan.

4436. Telbna Sp. (?)—Japan.

4437. Limnaea—Japan.

4438. Lampiana Multiformis—Japan.

4439. Ostrea Sp. (?)—Taken from the bottom of a ship in Japanese waters.

4440. Mactra Sulcataria—Japan.

4441. Limnea Auricularia—Japan.

4442. Rapana Sp. (?)—Japan.

Meetings and Elections

Mt. Diablo M. Co., Dec. 18. Directors: W. E. Norwood (President), J. M. Shotwell (Vice President), H. H. Allen, G. W. Grayson, J. N. Knowles; R. W. Heath, Secretary; Bank of California, Treasurer; W. H. Shockley, Superintendent.

Andes M. Co., Dec. 18 Directors: M. Landers, R. F. Rogers, A. O. Colon, Henry Casey and Butler Burris. Cash on hand, $8,392.05.

Gould and Curry M. Co., Dec. 18. Directors: W. S. Hobart (President), A. B. Hull (Vice President), A. Hayward, Robert Sherwood, Wm. Kent, S. Heydenfeldt and George Congdon; A. K. Durhrow, Secretary; H. H. Penoyer, Superintendent.

A MEETING of the blast furnace men of Pittsburg and surrounding country for the formation of a mutual protection association is called for the 27th of this month.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

ZEILE.—Amador *Ledger*, Dec. 16: It is freely reported that at the 800 level, running north, the ore body has been reached. This is the deepest level in the mine, and no ore has been raised from this depth so far. Prospecting has been going on for some time, with a view of tapping the ledge at this level and ascertaining its value. It is gratifying to be able to state that the ore encountered is larger in size and richer in quality than any met with in the upper levels. The precise width of the pay matter cannot be given at present, as it has not been definitely ascertained, but enough is known to warrant the statement that it exceeds anything heretofore worked. It seems to be a uniform feature in this mine that the quartz increases both in size and richness as depth is attained; and as the mine is yet in its youth, the mind is staggered in contemplating the wealth which may yet be unearthed by future explorations. At any rate the present outlook is better than at any time since the recommencement of work. There is an abundance of ore in sight in all the levels, enough to last for years.

MISCELLANEOUS.—The Bunker Hill company, it is stated on good authority, will square up all indebtedness shortly and resume operations. Taking water out of the shaft has been kept up steadily. Negotiations are in progress to rent the Kelly mill to crush rock from Morgan's mine in Murphy's gulch. The affairs of the Jackson mine are in anything but a satisfactory state, financially. Work is still progressing, but it is evident that matters will come to a crisis ere long. The trouble is that the principal stockholder of the company to which the mine has been bonded has withdrawn from the scheme. It is the general impression that the development of the mine will go on. The prospects are said to be sufficiently encouraging to induce others to take hold, even though the present company should surrender it. We are informed that the last crushing paid $8 per ton.

A RICH STRIKE.—Amador *Dispatch*, Dec. 16: We were shown this (Friday) morning a very rich piece of rock which had been taken out of the 300 level of the Ginocchio mine, near town. It is not yet known how extensive the body of ore is.

CALAVERAS.

BIG CLEAN-UP.—Calaveras *Chronicle*, Dec. 10: The boss hydraulicist, Geo. Emerson, has recently made a clean-up in Penoheott hydraulic claim on Tunnel Ridge, and the showing is somewhere in the neighborhood of $8,000. Pretty good. The Penohscot is not behind in the yield of auriferous matter.

SHOWING WELL.—The old Beaver mine, near Rich gulch, we are informed, is showing well. Work has been prosecuted in the mine for some time past, and the developments are such as to justify the construction of an arastra. The hoisting will be done by horse power, a whim being constructed for that purpose. Messrs. Bublert & Meyers are the parties who have the mine in hand.

PROMISING.—Good rock has been struck in the Mountain Rose mine, near West Point. The shaft is in 85 ft in depth, showing a vein of quartz 2 ft in width and rich rock. A company will take the mine in hand, we are informed, put machinery upon it and work it. The Carey mine is also showing well. The shaft is down about 50 ft. A pump will be put in order to continue work.

CAMPO SECO.—The first and most important interest here is copper mining. The old Campo Seco copper mine has been bonded to Mr. C. Borger, who represents a company, and who has put on machinery and reopened the mine, and things look as though they meant business. They have now in their ore-house 150 tons of ore ready to ship, and can take out 25 tons of ore daily that will average 12 per cent. They have let a contract to Capt. B. A. Messenger to deliver 500 tons of ore to Wallace station, and he will deliver the same in 30 days if the weather and roads are favorable. The Captain has also taken a contract to deliver to the mine 300 cords of wood to be used in reducing the ore. There is no doubt but that this is to be one of the best camps in the county, and when the Narrow Gauge railroad reaches a point where the copper and iron from the mines can be shipped for one-half the expense, they will be able to run a train every day for these products alone.

EL DORADO.

MASSIVE LODE.—Georgetown *Gazette*, Dec. 16: Undoubtedly Messrs. Keefer & Watson, of this place, have a big property near Garden valley in a copper, silver and gold mine. The lode on which they are now prospecting is 6 ft wide, but the surface shows other lodes of similar ore in close proximity, which, in depth, it is believed, will be united in one massive lode. The croppings are plainly traced along the line for a quarter of a mile. They are now down to the water level, and the character of the ore is much improved. Indeed, it is admired by every person who has any knowledge of silver and copper ores. We have just made a few tests of the specific gravity of this ore, which reaches all the way from .4 to .5. One piece weighing 200 ozs weighed 156 ozs under water. A thorough assay of ore from this mine was obtained in San Francisco some months since, which gave of copper about 15 per cent., silver $7 and gold $4 per ton. We are familiar with the character of the ore taken out at that time, and it is very evident that the ore now taken out is at least 15 or 20 per cent. more valuable than that from under the surface. It may be that the ore gains in silver with depth. The owners intend soon to begin taking out ore for shipment.

NEW MINES.—Last week we spoke of the evidences now presented of increased activity in mining enterprises which are about to start up in the spring. A number of new mines, requiring several hundred inches of water, are preparing to start up in a few weeks. In a conversation with Managing Director Hudley, of the California W. & M. Co., he informs us that the prosperity of this Divide for the coming season were already assured; that the new demands for water was sufficient already for more water than the present limited capacity of their ditches could possibly carry, and that the enlarging of the main ditches would necessarily be the next important move of the company. The storage capacity of Loon lake has been greatly increased during the past season, and by completing the hight of the dam next summer the storage will be ample to supply all the water which will be needed for a generation to come.

MILL CITY.—Cor. *Mountain Democrat*, Dec 16: Every advantage is being taken of this beautiful weather in completing the new mill on the Melton mine. The tramway will be ready for the cars by the 17th, and the mill also will be ready to start. This will probably be one of the most complete works in El Dorado county. There are three tunnels opened into good ore. Two are now being driven. These are about 700 ft above the mill; one 50 ft above the other. Below these about 100 ft is an ore bin that will hold 150 tons of rock. From the upper tunnel there is a chute leading down to a small bin at the mouth of the lower tunnel, so that the cars on the lower track can dump the ore from both tunnels into the large bin. From this last named bin starts the tramway 600 ft in length, on an incline of about 30 degrees, double track, with all the modern appliances. There are now about 40 men employed at the mine. The Lyon mill keeps steadily going, a recent clean-up showing an improvement in the ore, or it may be more gold was saved by using a screen of 2,500 holes to the square inch instead of 1,600, an experiment tried on the last run. A large boiler for heating water was landed at the mill this week and several loads of lumber, for the purpose of building another sleeping-house, covering the huddle, sluices and boiler. We understand from good authority that Mr. Lyon intends yet this winter to put up an engine and hoisting works at the mine, and has already purchased the machinery. The weather will probably have something to do with his

carrying out his intention. Between 30 and 40 men are working at the mine. This will undoubtedly be a lively camp next season.

INYO.

THE KEYNOT.—*Independent*, Dec. 16: Supt. McEvoy was in from Beveridge during the week. The Keynot owners had made a clean-up of their ores worked in the mill on the last run, but we could get no particulars as to the amount of gold yielded. The mill will reduce a lot of ore from the Lapwing mine and then resume work on the Keynot output. It is rumored that Mr. Lasky and others, of Lone Pine, are about putting up a mill in the canyon, just below the Keynot, for working its ores.

NORTHERN INYO.—Mining matters are on an ascending scale. The near approach of the railroad is already effecting a rapid change, and an excitement is slowly rising that is wide-spread and bids fair to become permanent. The Sacramento mine and the various mines adjacent are now claiming the most attention. There are parties now negotiating for its purchase. That it will be sold in a few days is beyond doubt. This has had a tendency to cause the prospectors throughout Piute and Bishop Creek districts to rush their annual work upon various other good properties. Hence, upon the streets we hear renewed the well-known cry of "Fest!" Again visions of wealth loom up before the miner and prospector, and again are they happy. Among them can be found men of almost all countries, and as they have come with the intention to "stay with it," at least until the railroad arrives and thereby reduces expenses, they will succeed. So numerous are the mines there is scarcely a man who makes the attempt to explore the White mountain range but that secures one or more favorable-looking claims. The Poleta mine is still in charge of Mr. Ford, and it is predicted by those who claim to know that a mill will be erected and work resumed on the mine within the next 6 months. Thus three properties will be brought forward nearly at the same time, viz: Sacramento, Poleta and Reed mines. Who will then say that the railroad is not of benefit to all. It would be useless to designate all the promising-looking mines, both developed and undeveloped, that lay along this mineral belt for a distance of over 20 miles. There are scores of them, and the average assays of all would far exceed $50 per ton, a figure that will in a few months rate as exceedingly profitable ore. The prospect is, indeed, a bright one, not only for the miner, but for the farmer, the merchant and tradesman, and for all classes

MARIPOSA.

THE COMPROMISE.—Mariposa *Gazette*, Dec. 16: This mine, which is situated about 15 miles above Coulterville, is fast looming into importance, and assurance of its wealth and permanency is being strengthened daily as the work of developing progresses. From a reliable source, from one who visited the mine on the first of the week, we learn that stoping in the lower north level, by means of two National machine drills, is breaking down an immense body of quartz rock of a vein from 2 to 4 ft in thickness of good milling ore, which is exposed for 100 ft or more. To the south, 50 ft lower down in the shaft, a level is started, showing, as far as it has gone, an immense body of quartz, and looks well. From this point to the next level is 100 ft, giving the company plenty of material to keep their fine mill in successful operation for some time. The immediate sinking of another 50 or 100 ft on the main shaft is being considered, which will give a continuous outpour of the golden treasure from the mine. Considerable money has been expended in developing this mine and constructing machinery, etc., but from the present outlook the investors will soon be well rewarded for their risk.

THE EMANCIPATA.—The people most interested in this section are anxiously looking forward to rich developments in this mine, which, judging from its earlier history, is doubly assured. The vein in the east level, which is 2 ft thick, is assuming a definite shape and shows free gold. In the west level a crosscut was made through vein matter 50 ft to the hanging wall, in which is a 3-ft vein of quartz, and shows well.

THE TEXAS.—This mine, situated on the North Fork, owned by Busebi, is reported to be bonded to Mr. Gilbert Douglass, of the Cook & Bros. mine, and work thereon will be commenced shortly.

SILVER.—The latest agitation of important silver mines are those situated at the base of Mount Raymond, about 12 miles above Big Tree station. Mr. John Leary, who has recently visited the locality, has formed a favorable opinion of these mines. He says the ledge is about 50 ft across and contains a great amount of base ores, containing silver, copper, lead and other base metals.

NEVADA.

MINING SITUATION.—*Foothill Tidings*, Dec. 16: The Idaho mine is looking well, and the brightest hopes are entertained for its future. The 14 level promises to open as well, if not better, than any level in the mine. The 13 level is looking well. The East Eureka is looking better than it has looked since its resumption of work. The miners are now working night and day running drifts. The ledge in the drift is a good one, and will amply pay for working. The Empire mine never looked better than it is now looking. The north and south drifts of the 13 level are showing up well. The ledge is pitching downward and seems to improve as it goes down. The Ajax mine, located on Wolf creek near Southern's mill, is being developed. The parties now doing the operating on this promising little ledge are Dr. S. Harris and William Henry Mitchell. The Ajax has been idle for a time, for reasons best known to the owners, but it is not their intention, by any means, to let the ledge remain idle. Work was done on the ledge of the Ajax some time ago, and a shaft 30 ft deep was sunk, but water came in very fast and work was abandoned. A 16-inch ledge was left in the bottom of the shaft, and it showed well in free gold and gold-bearing sulphurets. The owners of the Ajax have unbounded faith in it. The Nevada mine, located on Ophir hill near the Empire, is in a good condition and gives every encouragement. The company contemplate erecting machinery very soon. The miners are now engaged in stoping. A recent crushing of 10 loads of rock from the Nevada mine yielded well.

PITTSBURG MINE.—Grass Valley *Union*, Dec. 14: The Pittsburg mill is now running on tribute rock taken from the mine. The new drain tunnel of this mine, which will strike the vein at the 300 level, and which has been in progress of construction about 2 years, is now in a distance of 800 ft, and will be completed during the spring months. A portion of the distance has been through very hard rock, some of which cost $30 per foot to excavate. The tunnel, when completed, will take up the heaviest part of the water which comes into the mine, as above the 300 level most of the water is encountered. By the construction of this South Yuba Co.'s new canal, from Quaker Hill to Town Talk, the company will be enabled to introduce water for milling and hoisting purposes, and economize largely in the matter of running expenses.

WASHINGTON DISTRICT.—Cor. Nevada *Transcript*, Dec. 16: The Yuba mine, lately sold by Col. Rogers to a San Francisco company, are pushing things at a lively rate this winter. They are now working 15 or 20 men, and employing more as fast as they can find room to work them to advantage. They are repairing their 15-stamp mill and having it fitted up in excellent manner. The same company own the Last Chance mine, and have several men employed running a tunnel to crosscut the ledge. They contemplate building a mill on the Last Chance early in the spring. At the Lindsey they have 6 or 8 men employed, but they do not intend doing much on it this winter. The Ocean Wave mine, owned and worked by Messrs. Pease & Percival, is a very promising mine. They are down about 40 ft, and have a 4-ft vein of ore in the bottom of their shaft showing plenty of free gold. At the Ocean Star mine they are working 10 or 12 men, running a tunnel to crosscut the ledge. They are in a distance of 230 ft, and have about 40 ft yet to make before reaching the ore vein. They have a very fine 10-stamp water-power mill on their property. Last, but not least, is the Cora Maud mine, discovered the past summer. It is close to the Ocean Star.

PLACER.

A PROMISING MINE.—Placer *Herald*, Dec. 16: Messrs. Hooper, Norton & Cooper, three young and energetic miners of Ophir, who lately commenced to work the Woodward lead on Dutch Ravine, had a crushing of 32 tons last week, from which they realized about $35 per ton. This is an exceptionally fine clean-up, and the boys are very naturally much encouraged. The main shaft is about 70 ft deep, and in the bottom the ledge, which is from 15 to 16 inches thick, looks very promising. An old tunnel taps the ledge 120 ft from the surface, which the boys are cleaning out with the intention of utilizing it. This lead was some years ago, we understand, worked by Judge Spear and others, and at that time yielded very fair results. The boys expect to increase the force and facilities, and are confident of being able to make a big showing before the close of many more months.

PLUMAS.

CRESCENT MINE.—Greenville *Bulletin*: After a 6-days run with 4 stamps a clean-up was made, yielding $1,607. This machinery for pumping out the old shaft is now about ready for work, and as soon as the water is sufficiently lowered men will be put to work in there running a drift into the new workings. The distance to be run is not great, and it is expected that a sufficient body of ore will be opened up to supply 16 stamps. The additional 12 will then be started up.

SOUTHERN EUREKA.—On Sunday morning last the crank pin strap of the engine was discovered to be cracked. The engine was at once stopped and a new strap made. About 36 hours' time was lost, work being resumed on Monday at midnight, and all at the mine is now running as usual. The yield from the mine has been very satisfactory during the past week, and there is ore enough in sight to insure that the future will be not less so.

SHASTA.

SOUTH FORK, NEAR IGO.—Cor. Shasta *Courier*, Dec. 16: Work has been resumed in the west stringer of the Bullion ledge, and with flattering results. The lot from this place worked last spring in the Chicago mill averaged nearly $200 per ton. The ore being taken out now appears to be much richer than that lot. Mr. McOlew has bonded the Dayton mine, and has a force of men at work on the same. The Smith boys have a good prospect on the Andreas creek side of the Divide. J. B. Strong's ore averaged $65 to the ton. Both arastras are running.

SIERRA.

THE PHOENIX QUARTZ MINE.—*Sierra County Tribune*, Dec. 14: Work has been commenced in earnest on the Phoenix quartz mine at Sierra City. A tunnel will be begun this week which will tap the ledge about 200 ft below the bottom of the shaft, that being down 300 ft. It is estimated that 500 ft of tunnel will reach the desired point. Everyone around Sierra City feels confident that the Phoenix is a valuable claim, and that in time it will greatly add to the population and prosperity of that town.

A CHANGE.—We understand that James McNaughton, Esq., will assume charge of the Bald Mountain mine when Supt. H. W. Wallis leaves for Sacramento to take his seat as Joint Senator for this and Nevada county.

THE ALASKA MINE.—The Alaska mine, at Pike City, is doing finely. The ledge is 2 ft thick and turning out splendid ore. Quite recently $3,000 worth of specimen ore was brought to the surface. Eighty-five men are employed in and around the mine. Capt. Shawhan continues to act as superintendent.

DIVIDENDS.—The Sierra Buttes mining company of this county paid in London last month a half-yearly dividend of 25 cents a share, aggregating $30,625, and leaving a balance of more than $63,000 in the treasury, which is reported as invested in good securities bearing interest.

LOGANVILLE.—A visit to the Marguerite mine on Saturday last was rendered very pleasant by the kindness of Mr. Deidisheimer, Jr. The hoisting works of this mine were enlarged recently to make room for the new boiler and machinery which have since been put in. The mine is now down a depth of 300 ft, and there are no signs of the ledge "pinching out;" on this contrary, it is steadily improving. The 20-stamp mill runs like clock work. This company is getting everything in readiness for the winter.

PROSPECTS WELL.—*Mountain Messenger*, Dec. 16: Louis Garibaldi and Mr. Van Gleason have located a quartz ledge near the old bridge in Slug canyon, and are developing it. The rock prospects well.

PHOENIX.—Deidisheimer & Busch have started a tunnel on the Phoenix ledge, at Sierra City.

GOOD LEDGE.—Mr. Bane has relocated the old Telegraph quartz ledge on the East Fork (the old Kruse ledge), and is making wages with a hand mortar.

UNCAS MINING COMPANY.—The Uncas mining company's property, better known as the Primrose and Good Hope quartz mines and mill, was sold at Sheriff's sale last Saturday, and brought the sum of nearly $4,000. The Uncas mining company has not been very successful. The company has had control of the property about 3 years, but has done little or nothing toward developing it. They have fixed up the mill, which had been allowed to go to ruin; have run a tunnel into the ridge back of the works; have filled up a shaft a couple of hundred feet deep, covering up two steam pumps, and have run through a little rock, and this is all. This property has been sold three times since. P. A. Lamping owned it. He did the last work done toward developing the mine, which was in 1875. The property was had in at the sale by plaintiff, Wilcox, the amount of his judgment and cost being $4,000.

TUOLUMNE.

QUARTZ.—Tuolumne *Independent*, Dec. 16: Louis Page has a fine quartz mine about 2 miles north of the old ice houses above Columbia. He works 7 or 8 men, and grinds his rock in an arastra. A run of 5 tons of rock yielded $228, or over $45 per ton. The ledge runs from 4 to 8 ft, and he takes his rock from three different places on the ledge.

THE EMPIRE.—This drift gravel mine is about to be opened by Dr. Blachley, of Nevada. The property is owned by a company of Nevada men.

THE SOULSBY.—This mine is yielding good rock. The vein at 630 ft is rather narrow, but is growing wider and more easy to get out.

NEVADA.

WASHOE DISTRICT.

OPHIR.—Virginia *Enterprise*, Dec. 16: The joint Mexican winze is still in ground that contains much quartz. It does not blast well. The winze will be sunk about 7 ft, the same as last week. The main south drift on the 2900 level is being advanced at the rate of 18 to 20 ft per week. Good headway is making in the work of putting in new pumping gear and in the general overhauling of the pumping apparatus.

MEXICAN.—Are progressing well with the work of straightening up at the point where the main north drift on the 2900 level connected with the south drift from the Union Consolidated. Crosscutting will be commenced the first of next week. The joint Ophir winze is still in about the same kind of ground as described last week, and about the same progress has been made in sinking.

HALE AND NORCROSS.—A joint drift is being run by this company and the Savage. The drift being run at the end of the north drift made by the Chollar folks at the 2600 level, and will be pushed through the Savage south line as soon as possible. During the week they have been principally occupied with timbering up the drift.

UNION CONSOLIDATED.—Good progress is being made in the work of putting in order the south drift on the 2900 level at the point where it connected with the north drift of the Mexican. This work will be completed and crosscutting commenced the first of next week.

CHOLLAR.—Good progress in drifting has been made during the week, and the material has been softer and more promising than heretofore. There is still a considerable belt of ground to be cut through before reaching the Potosi line.

SIERRA NEVADA.—Good progress is being made in the cross-cuts on the 1700 level. The material thus far encountered is much the same as was found in the main north drift.

CALIFORNIA.—The joint California southeast drift is being run at the rate of 18 to 20 ft per week in ground of a favorable appearance—a mixture of clay, quartz and porphyry.

OPHIR AND CURRY.—The west cross-cut on the 2900 level is out 80 ft. It is in vein material of a favorable character. The ground is dry, and does not require to be timbered.

BEST AND BELCHER.—Work has been suspended in the main north drift, in order to allow the water to drain out from the face where a drill-hole was made.

ANDES.—The drift north from the winze is in vein material which shows a good deal of quartz. A cross-cut is being run from the south drift.

CONSOLIDATED VIRGINIA.—The joint California east drift is advancing at the rate of 18 to 20 ft per week. This ground works very well.

YELLOW JACKET.—At the Winters shaft they are now taking out of the old upper levels about 50 tons of ore per day.

EUREKA DISTRICT.

SHIPPING.—Eureka *Sentinel*, Dec. 10: The Jackson tributers are shipping to the furnaces the old lava beds dump, which yields from $40 to $50 per ton. There is still enough left to keep a furnace running for a month or two.

THERE are three men working in the Republic mine on Prospect mountain. Some very fine looking quartz is being extracted by one man. The other two are tunneling into the hill to get under the body.

THE Eureka Con. tributers are getting lots of ore. The ore dumps are all full, and the tributers are anxiously awaiting an opportunity to ship it to the furnaces for reduction so as to enable them to make a raise for the coming holidays.

MESSRS. MOLINO & FRAZER, who took a lease of the northerly end of the Silver Lick series about a month ago, have been very successful. They have about $3,000 worth of ore on the dump, and are said to be now making as much as $100 each per day.

GRANTSVILLE DISTRICT.

AN ORDEAL.—Grantsville *Bonanza*, Dec. 16: Grantsville is at present passing through the same ordeal that nearly every mining camp in the State has undergone at some time in its existence. It is more than a year since the sound of the miner's hammer or the music of the stamps in the mill has been heard in our camp. The long period of idleness has told severely on us in point of population and general business prosperity. The once time bustling streets have now a painful appearance of desertion, and a person visiting this place after an absence of two years would scarcely recognize the town. Still the feeling of the people left is not like that usually found in sleeping mining towns. The fact that one mine (the Alexander) kept 40 stamps running steadily for nearly four years, turning out bullion in large quantities, and that its ore bodies are now as large and rich as ever before, and the additional fact that other mines equally as valuable lie ready to reward the enterprise of capitalists, renders it certain that ere long the town will be more prosperous than ever. This being the feeling given men who are interested here the nerve to remain for the rise of the camp.

MOUNT COREY DISTRICT.

A ROAD.—Bodie *Free Press*, Dec. 16: One hundred and fifty Chinamen are now at work on the wagon road leading from Hawthorne to Mackay and Fair's mine at Mt. Corey. It is the estimate of an expert that there are $1,000,000 worth of ore in sight in this mine. It was purchased by the present owners for $15,000. When the road is completed one of the large mills from Virginia City will be moved over, and the work of turning out silver bullion will be commenced. There are other prospects in the district, but none of them show up like the one in question.

SILVERADO DISTRICT.

IMPROVING.—Eureka *Sentinel*, Dec. 16: The Western Globe mine at Silverado is showing signs of improvement. The tunnel has been connected with the shaft, which has been carried to a depth of 43 ft below that level, whence a drift is being driven south on a vein of good ore from six inches to a foot thick.

TUSCARORA DISTRICT.

THE BASIN MINE.—*Times-Review*, Dec. 16: Yesterday, in company with Mr. W. S. Hillman, we visited the Basin mine, in which Mr. Hillman, as representative of a Massachusetts company, is the owner. Crossing Eureka gulch, from which so much gold dust has been taken, our course was north and up the ridge to the hoisting works. The mine is well located for easy and effective working. The dumpage room is ample, and at no time can there be any liability to trouble from water. The quality of the ore is far above the usual grade. The quantity of ore is increasing, and the formation and regularity of the walls is a sure promise of a permanent and valuable property. All this has to be proved by labor—the pick and shovel must go ahead, and money must be put in the ground to get money out. We congratulate the Massachusetts company on their selection, both of mine and manager.

WHITE PINE DISTRICT.

THE RECENT STRIKE IN THE EBERHARDT.—White Pine *News*, Dec. 16: From parties recently arrived from Hamilton we learn that a very important ore discovery has been made in the west drift from the Eberhardt tunnel. This ledge is said to be 4 ft wide, giving assays all the way from $80 to $600. Our informant states that $150 would perhaps be a fair average of the ledge. This ore deposit is 1,700 ft below the surface, and from our knowledge of the ground, must be west of the town of Treasure City. The ore, it is said, carries considerable copper, and it is altogether different from that found in the upper workings. In fact, it appears that Capt. Drake's work has penetrated the base zone, which is known to exist on the surface in the neighborhood where the recent strike was made. The discovery at this place is fortunate, as it will further stimulate the company to renewed exertions in their prospecting, which many think they were on the point of abandoning at the time the new find was encountered. If pluck and perseverence, backed by well-directed exploration, are the elements necessary to bring wealth out of the depth of Treasure Hill, Capt. Drake will yet gladden the hearts of his London friends with a bonanza that will repay them for all their outlay.

ARIZONA.

CASTLE CREEK COPPER DISTRICT.—Cor. Phœnix *Herald*, Dec. 16: Our first halt was at the mines of Collier & Co., which are being worked. Their mines show up as well as one could reasonably ask. The company have sunk a shaft 5x7 ft, which is now down 90 ft, and have run a tunnel 118 ft in length, which intersects the vein at the depth of 70 ft. The crosscut of the vein shows 7½ ft of copper ore, which assays from 18 to 60 per cent. of copper. From Collier & Co.'s camp we passed over to the Mayflower, a distance of four miles. This mine is owned by Mr. Chas. Thompson, of Tip Top. He has a 4x7 ft shaft down 83 ft, the whole distance in good ore. At that depth he concluded he had not all the vein, and crosscut for 18 ft, when he struck a large, fine vein of copper ore, 9 ft across. From the Mayflower we passed on to Whipsaw Gulch, where we found the camp of Messrs. Roberts & Co. They have an excellent property, which was sold last fall to a Colorado company, Messrs. Roberts and Buchanan still retaining an interest. Leaving Whipsaw Gulch, we passed by way of Castle Creek Falls to the Cushingberg mines on the east side of Castle Creek. The mines are silver producing, assaying $200 to $500 per ton. Messrs. Shriver and Thompson are sinking on the Jackson, Kentucky, Doubtful and others. A shaft 4x7 ft is now down 24 ft on the Jackson, in good copper ore all way, some 25 tons of which are now on the dump. On the Kentucky the ledge is opened in four different places, all showing good ore clear across the ledge, which is about 4 ft wide. These two mines, the Jackson and Kentucky, are both in the same lead, which runs north and south. The Doubtful claim crosses the Kentucky lead some 60 ft to the north of that claim. These claims begin to assume the aspect of mines, and the camp bids fair to become one of the best in Castle Creek. Their camp is a perfect network of mines in all directions.

COLORADO.

UNKNOWN.—Georgetown *Courier*, Dec. 16: The Unknown lode, belonging to W. P. Farris, is producing ore, and is being worked under lease.

HIGH-GRADE ORE.—A late mill-run from the Summit mine returned at the rate of $2,000 per ton.

THE DELAWARE'S BONANZA.—There is considerable excitement at Decatur over the strike of 4 ft of high-grade gray copper and galena in the Delaware mine.

SAM, Dave and Robert Syster sold their lease last week on the White lods, Red Elephant, to Capt. Longacre and John Gates for $1,200. During the past four months the boys have cleared about $12,000 from their lease, and now they will return to their home in Pennsylvania to enjoy it.

MURPHY.—The Murphy mine, near Empire, is being worked on lease by Harvey Cowles & Co., who have been taking out good pay for the past month, and are still at it. About two weeks ago a mill-run yielded 13 ounces in gold per ton. The pay streak averages 3 to 6 inches, and is impregnated with free gold.

PAY ROCK CONCENTRATION WORKS.—The building of these works is about completed and ready for the machinery. The water power can be used for nearly 11 months during the year. There are about 2,000 tons of concentrating ore on this dump, that will run nearly 30 ounces. There is on the different dumps ore enough to keep the mill running two years.

DRAINAGE TUNNEL.—Over $3,000 were expended last month in improvements. It is the intention of the company to get everything in first-class shape, when they will commence working their mines on a larger scale. A new double track is now being laid in the tunnel. No. 4 has from 1 to 2 ft of scattered ore, which mills 54 ounces silver and 32 per cent. lead.

MASCOTTE.—Henry C. Parker has struck it big again in a new place on the Mascotte, situated on Anglo-Saxon mountain. The ore contains 50 ounces silver, 70 per cent. lead, and gold enough to make ore worth considerably over $100 per ton. The Mascotte, although not very much developed, is rapidly taking its stand as one of the steady producers of this camp. Mr. Parker has always worked systematically, and never has gouged the mine, but has made the work of developing more than pay for itself.

JACK FROST AND GLOBE.—Joseph B. Johnson reports that his Jack Frost lode is opening out splendidly. He has struck a fine body of argentiferous galena in the Globe. The pay streak is 8 inches thick. A run of 1,600 pounds gave 50 ounces silver and 60 per cent. lead. He has a fine specimen in his room, weighing about 150 pounds. Mr. Johnson sticks by Argentine mining district, and has been well compensated in so doing. His properties are in East Argentine, near the Wheeling and Paymaster.

UNION TUNNEL.—W. F. Kelso and J. P. Davie are driving the Union Tunnel into the Kelso mountain, and utilizing the Ralphaleta lode for that purpose. The lodes they propose cutting are the Cross Cut, Wooton, Ora Belle, Silver Glance, Mamie, Snow Drift and White Quail. The tunnel is in about 380 ft, and has cut the Wooton and Cross Cut.

VIRGINIA CITY.—This mine is situated on the south slope of Lincoln mountain. It has been opened by a shaft of considerable depth, and some drifting and stoping has been done. The lode has produced some pay. Owing to water and bad air, it was found difficult to work the mine, however. Last spring a party of lessees went down the hill and started a cross-cut to intersect the lode at a depth of about 75 ft and some distance below the shaft. Before the vein was cut the work was abandoned. Lately Capt. T. O. Cree leased and bonded the mine. He continued the cross-cut until he struck the lode, and he informs us that he now has from 8 inches to a foot of mineral, assays from which return $300 to the ton. He believes he has struck a bonanza.

IDAHO.

GERMANIA DISTRICT.—Ketchum *Keystone*, Dec. 14: H. E. Hendrick and others, of Hailey, have a force of six men employed on the Chlorida mine in the Germania district. Cabins have been built, 7,000 pounds of supplies laid in, and all conveniences arranged for continuing the work through the winter. There are now 600 sacks of ore on the dump, ready for shipment to the Vienna mill.

BAYHORSE.—Idaho *Messenger*, Dec. 16: The winter having closed down for the year at this point, it is appropriate to see what has been the result of the season's labors. To state it briefly: The smelt of this year has equalled that of '80 and '81. This one stack has shipped 38 car-loads of bullion. The owners, the Omaha Smelting Co., have also shipped 5 car-loads of ore so rich that it was nearly equal to bullion. Besides, they have shipped 1 car-load of copper matte, and have stock on hand left over of a few thousand dollars in value, making a grand aggregate for the year, together with the light stock on hand, of $425,000. This, for one inexpensive plant, is, perhaps, a little hard to beat. This camp, put in motion as is now under contemplation, will produce for the year 1883 some millions of bullion, and without any extra force of machinery will not fall behind '82, as the camp is getting steadily better.

OREGON.

NOTES.—Jacksonville *Times*, Dec. 16: The iron deposits of Jackson county are attracting more attention than ever.....A. W. Sturgis, of Forest creek, is still drifting, and has sufficient water for present purposes.....C. W. Burrage and others are still prospecting the hills in the vicinity of Rock Point for iron ore.....Springstead & Co. have an arastra at work at their quartz ledge at the head of Wagner creek. The prospects are promising.....S. L. Fields came over from Kerbyville this week, from whom we learned that many of the miners of Josephine county are busy.....DeLematter Brothers are ground-sluicing at their claim near Kerbyville, while DeLematter & Newman will soon have their hulkhead in, and will then be ready for an extended run.....H. T. Hutchins, of Galice creek, is in town, from whom we learn that Green Brothers are again taking out a considerable quantity of rich ore. They have not crushed any since July, but have run a winze, with excellent results..... R. W. Derrickson, of Horsehoe, Josephine county, visited Jacksonville this week. He informs us that the quartz mill has been shut down for the present, and that considerable ore of excellent quality is being taken out daily.

UTAH.

CHRISTY M. & M. CO.—Silver Reef *Miner*, Dec. 14: The various mines belonging to the Christy Company are being vigorously worked under the able management of Capt. Lubbeck. Their numerous properties are in a condition to supply a large amount of paying ore when demand is made upon their treasure vaults. Shipments of ore to the mill are constant, which enables the bullion output to be regular. A much needed improvement has lately been inaugurated by this company in the form of new hoisting works in the vicinity of the main ore deposits, which will greatly facilitate the working of the mines and also enhance the value of the properties. The new engine, with other necessary improvements connected with it, will cost, when the work is completed, about $10,000. The mammoth smokestack was put in place on the 4th inst, and the rest of the work will be completed in a week or two.

STORMONT.—This property, from its durability and steady output of good ore, has been one of the greatest benefits to the growth and development of the camp in the past, and still holds a better "grip" on improvement and advancement daily. The bodies of ore in the various deposits are looking better at each step of development. The mill is running at full capacity, with bullion shipments per Wells, Fargo & Co. as formerly.

BARBER & WALKER.—In our last issue we stated that this company had closed down for the time being under attachment for debt; but we learn that the indebtedness is being paid off, and the mill will be put in motion at an early day, which we firmly believe will be the case. We see no reason why the property should long remain encumbered, as there is an abundance of good ore in sight and the mine and machinery in good shape for constant and successful manipulation.

The Denver Exposition—No. 18.

[Editorial Correspondence.]

Passing from the more northern States and Territories of the Rocky mountain range which, until quite recently, were unknown to any representatives of the white race except the trapper or explorer, we come now to

The Territory of New Mexico,

Which occupies quite an anomolous and at the same time a most interesting position in the great family of American States and Territories, and has a history all its own. While it is one of the newest of our Territorial organizations, at the same time it contains the oldest European settlement in the Union—Santa Fe.

So much interest attaches to the early history of this region that our readers, we are well assured, will appreciate a brief reference thereto, even if the matter does not strictly appertain to the chief subject to which this series of letters is devoted.

The Pueblos of the Fifteenth Century.

The aboriginal inhabitants of this region were justly entitled to be ranked among the civilized racee of the earth. When the Spaniards first met them in the neighborhood of Santa Fe they numbered hundreds of thousands. Mostly collected together in cities and large towns, they also maintained a populous, thrifty and industrious suburban population scattered all through the broad extent of country now known as New Mexico. This country was visited and fully described by a Spanish writer, Antonio de Espejo, more than three centuries ago. That writer reached the confines of the present Territory from old Mexico by way of the valley of Rio del Norte, which crosses the middle portion of the southern line of the same at El Paso, and extends northward quite to the northerly line of the Territory. Espejo traversed that entire valley, making frequent detours to the east and west of it to visit outlying provinces and cities. He writes of having visited a city which must have been located 30 or 40 miles northeast of what is now Albuquerque, where he found a population of fully 40,000 people in the midst of a "very fertile and plentiful" province, abounding with timber and precious metals. Returning to the valley he next visited another city, with a population of 20,000, "containing eight market places and better houses, the latter plastered end painted in diverse colors," where his companions were "presented with many curious mantles and victuals excellently well dressed." This place was called Zia, and was considered "more curious, of greater civility, and better government than any other pueblo hitherto seen. The next place visited was "Jemez," with 30,000 inhabitants, which was "well provided with all necessaries" of life and a "good government." He next visited Acoma, "situated upon a high rock, and reached by steps cut in the rocks." His next visit was to the province of Zuni, to the west of the valley of the Rio del Norte, and containing a population of 50,000.

Espejo often speaks of the fine dwelling houses, some of which were four stories high, and writes approvingly of their methods of cultivation, their habits of industry, the provident care of the people by the ruling classes and their generous hospitality. The women are referred to as "cleanly, with hair well combed and dressed," both sexes being "dressed in cotton cloth and deer skins," the latter tastefully prepared. Such were the ancient inhabitants of New Mexico. The ruined dwellings and cities of this interesting people are now found following up to the head waters of the Rio del Norte into the southern part of Colorado; also westward into the more fertile valleys of Arizona. They also abound throughout all the northern and central portions of Mexico proper. Such was the condition of this interesting people when the early Spanish travelers and missionaries first came among them. The very earliest respected their civilization, their property rights and their forms of government. They were kindly received and hospitably entertained, but it was not long before the story of the rich silver and gold mines of the country reached the ears of the Spanish conquerors of old Mexico, whereupon the followers and successors of Cortez pushed their arms up into this region, conquered it and worked on an extensive scale its mines and placers. Ruins of old cities and towns, with their churches turreted and loop-holed for defense, are found scattered all over the country. "Numerous ruins of smelters are also found, giving indisputable evidence that mines were once worked on a large scale. Two hundred years ago the Indians who had been enslaved and forced to work these mines broke out in rebellion and drove the Spaniards from the country. So intense was their hatred toward those places in which they had been forced to labor that they filled up every old mine so that no trace could be found of them. A number of years after the Spaniards were allowed to return to the country, but only on condition that the mines should never be opened or worked. This condition seems to have been faithfully kept, and for many years mining was wholly abandoned in the Territory.

During the early part of this century we hear of some of these old mines being opened and new ones being discovered, but they were never worked to any great extent. The Indians were hostile, transportation was expensive, and the methods of working ore very crude, and it is only within a short period that the mines of New Mexico have begun to attract attention. For 200 years they have been lying dormant, but their rest is mostly ended. The tireless prospector will soon cover every hill and mountain, and every stone will be upturned in search of mineral wealth."

This invasion and enslavement destroyed the peaceable, quiet homes of this people, and broke up and discouraged their national spirit to such an extent that they gradually, as opportunities presented, left the country, many going south among those who were more nearly associated with them in habits and natural characteristics; while large numbers joined the tribes of roving Indians to the north. A few remained and became mostly merged into the civilization of their conquerors. By these various dispersions the numbers of the true descendants of the Pueblos have been gradually reduced, until now not more than 10,000 of these people exist as a distinct race; and even this small number has greatly degenerated from the rank in civilization which their ancestors held. While there are yet to be found in this region a few of the genuine descendants of the original Pueblos, also a few true Castilians, the great bulk of the population is made up of the blended descendants of the two races, who are now living in domestic simplicity and peacefulness, tilling the soil or herding a few flocks for a scant support of life, or hunting the buffalo in season, dwelling in houses of sun-dried brick or of stone, and usually closely clustered around a common plaza, all much as when disturbed by the first coming of the warlike, gold-seeking Spaniard. To these may also be added a few roving bands of predatory Indians, who subsist by hunting and robbing, but whose occupation is fast passing away in consequence of the advent of the railway and the rapid increase of a steady, order-loving and law-abiding white population.

The Advent of a New Era.

Since the advent of the gold-seekers on the Pacific coast New Mexico has been gradually filling up with emigrants from the Eastern States and Europe, drawn thither by the fame of her mineral deposits and the genial climate, which rivals even Italy in salubrity. Of late a new and important era has dawned upon this rich and interesting region. An entirely new civilization has once more appeared upon this classic ground. The onward march of steam in its mighty, irresistible course has again peaceably met mediæval conservatism face to face, and the modern plow and all its accompaniments have confronted the crooked-stick plow and other industrial methods of bygone centuries. What the result will be needs no prophetic vision to unfold. The extension of railroads into and through the territory is rapidly developing its resources, by affording better means for obtaining supplies, and in attracting the attention of tourists and capitalists to the wonderfully rich and extensive mineral deposits, which are now beginning to be developed on a scale somewhat commensurate with their extent and importance.

Railroads in New Mexico.

There is no State or Territory in the Union, of like sparse population, which possesses such a perfect system of railroad communication as New Mexico. The Atchison, Topeka and Santa Fe railroad has been completed to Deming, in the southern part of New Mexico, and at that point connects with the Southern Pacific railroad. At Rincon the former railroad has a track following the Rio Grande to El Paso, in the State of Texas, where it connects with the Mexican Central railroad, now completed from El Paso del Norte to the city of Chihuahua, and having the City of Mexico as an objective point. Connection is made with Santa Fe by an 18-mile branch from Lamy Junction. Branches to the coal beds adjacent have been constructed respectively from Raton and San Antonio. A branch to the Las Vegas Hot Springs has likewise been constructed, which makes close connections with all passenger trains. Other branches from the main line have been projected to connect with various outlying points, and which are either in course of construction or will be constructed in the early future. The length of line constructed in New Mexico belonging to the A. T. and S. F. system of railways is 575 miles.

The Atlantic and Pacific railroad, beginning at Albuquerque, on the Rio Grande, extends in a westerly direction to the western boundary of New Mexico, and into central Arizona. It has the city of San Francisco, in the State of California, as its objective point.

The Denver and Rio Grande railroad enters the Territory near Antonio. Of the San Juan division of said road, running west, there are about 60 miles of track in this Territory. The New Mexico division of that road extends from Head's Station to Espanola, 28 miles north of the city of Santa Fe, running nearly due south, with 80 miles of track. The Southern Pacific railroad extends entirely across the southern portion of the Territory, running almost due east, from which branches have already been constructed, or soon will be, to all important points north and south of its main line. Other roads are being projected or are in course of construction to connect the Black Hills and other important mining districts with the main line of the Atchineon and Topeka railroad.

Roads are also projected and being constructed from Trinidad, in the State of Colorado, to Las Vegas and the Rio Grande, and from Socorro, on the Atchison, Topeka and Santa Fe railroad, to the Black Range and the Mongollon mining camps. The Gulf, Colorado and Santa Fe railroad is in course of construction from Galveston, and is expected to reach the city of Santa Fe in eighteen months. The Atlantic and Pacific railroad, from the Indian Territory west, will doubtless be built, and will strike the eastern boundary of the Territory near the Canadian river, and Albuquerque on the Rio Grande. Companies have been organized to construct roads respectively from Deming to Silver City and from Lordsburg to Clifton, Arizona.

New Mexico's Overland Trade.

The construction of such an extensive system of railroads is not only building up a rapidly increasing overland trade, but is also bringing great numbers of miners and prospectors into the Territory. The same cause is attracting thither a large amount of capital. The late Exposition at Denver, and the active interest exercised by Commissioner Sloan, also added largely to the benefit of the Territory in that direction. All these things combined are working together to build up a lively overland and interior traffic, and will soon furnish sufficient local business for the four main lines and all their present and contemplated branches to make them fully profitable. As long ago as 1876, the latest data we have before us in this particular, the overland trade alone amounted to $2,108,000, since which time it must have more than doubled.

The Exhibit of New Mexico at Denver.

This Territory was well represented at Denver both in its mineral exhibit and also in regard to the intelligence and urbanity of those who had it in charge. Judge W. B. Sloan was Commissioner-in-Chief. Over 1,000 mines were represented, to which, however, was subsequently added about 12x12 ft. additional space, which was devoted to the exhibit of a large invoice of minerals which arrived when the exhibition was about half over. Most of the display was made upon two long platforms with rising steps beginning near the floor and extending upward until they met at an elevation of about six feet. These shelves or steps were covered with red and blue cloth, on which the minerals were carefully arranged, so as to show to the best advantage. The 12 ft. additional space was arranged in the same manner.

The exhibit was essentially representative in character, most carefully and judiciously arranged in groups by counties and districts, and without any attempt at effect or show. Great credit is due to Commissioner Sloan for the energy and industry he displayed in getting together and putting up this display, and for the pains and patience he manifested in aiding visitors, through the medium of this exhibit, to gain a correct knowledge of the mineral resources of New Mexico. We shall give a brief account of the mines and mineral resources of New Mexico in our next. W. B. Ewer.

Gravel at Big Bend, Rogue River.

A correspondent of the Del Norte *Record* a short time since wrote as follows: I have been promising to write you something in my crude fashion about this wild undeveloped region, but have been delaying the matter for the purpose of gathering more information regarding it. I have tramped and prospected considerably, and yet can hardly say I have more than partially investigated any of it. My perambulations have extended about 15 miles east and west by three miles north and south. Everyone has a right to his own hypothesis of relative deposits, and mine is that the immense gravel range at Big Bend is not the washing of Rogue river, but of some ancient stream running north or south. I have traced the gravel field about four miles east and west, and find an entire different formation of bedrock where it ceases, both up the river and down it, and wherever I sink into the solid gravel I find gold. The bedrock here is in silicious slate, if the term may be admissable, at least it is a mixture of slate and sand predominant with other matter. It is made up of globules flattened and lengthened, which are composed of layers or shells, that may be broken off about an inch in thickness down to the center where is generally found a small, irregular shaped stone. This shows that the formation is neither by fire nor washing, but by being periodically shaken and rolled in a pasty state, every agitation forming a new layer. I am not able to say how deep this formation extends, but a depth of 100 ft. may be seen along the banks of Rogue river. The gravel above this bed rock as far as my investigations go, is from 20 to 70 ft. deep, and yields a small prospect of gold from the surface to the bed rock. That a hydraulic or giant would yield profitable returns I have no doubt. Foster creek, running into the river at Big Bend, will furnish a stream for two giants nearly all the year. The water right of it is located by a company from Ellensburg, who have just finished the survey of a ditch to bring the water about 200 ft. above the lower flats. An abundance of winter water may be had for hydraulic purposes. Of other minerals I have found coal, silver, platinum, magnesia, iron ore — chromate and black and brown hematite. Many low bars along the river prospect well and are vacant. I have seen 50 cents to the pan taken from the honest gravel, neither from crevice nor on the bedrock. The country is absolutely unprospected. Considerable gouging for small stocks has been done along the edges, but a veritable prospect hole in the heart of the thing is a rarity.

The mountain canyons and valleys along the river abound in valuable timber. Pine, cedar, fir, sugar pine and hard woods, as oak, maple, ash and myrtle. A few tons of dynamite used judiciously demolishing obstructions in the river, to make log driving more feasible, would open a vast tract of timber to the enterprise of lumbermen. It is a rough country to travel through, but the climate is excellent, the atmosphere pure and healthy, game and fish abundant, making it a delightful place to anchor for a while.

The old mountaineer settlers are hospitable and generous. Most of them have farms, gardens, orchards and vineyards, but their chief business is stock raising.

A Novel Tunnel.

How an Eastern Superintendent Was Worked by an Old-Timer.

While the Clark's Fork mines are not in the regions of eternal snow, the fall there is by no means inconsiderable. A story is told of a tunnel run on a lead in that district to a depth of 225 ft., which is deserving of being immortalized in print. Some two years since a party of Eastern capitalists made a purchase of the Silver King lode. They sent out as a superintendant a dapper little chap from New York, who knew no more about mining than a Crow Indian does of geometry.

The Superintendent, Mr. Smythe, came to Bozeman, hired a retinue of cooks, teamsters, etc., and went out to the mine. It had not been developed to any extent, and after an inspection of the prospect shaft, Mr. S. determined to have a tunnel run on the property. He announced his intention and asked for bids. An old-timer and prospector named Jackson, hearing of Mr. Smythe's wants, went to see the embryo superintendent. It did not take Jackson long to "size up" his man, and in a short time he had contracted to run a tunnel on the lead to a depth of 225 ft. Explaining to Mr. S. the character of the formation, and telling him that in soft rock he could make fair headway, he undertook to run the tunnel to the required length for $20 per foot, or $4,500 for the work. A payment was made Mr. J. on the spot of $1,000, and Mr. Smythe went to St. Paul, the tunnel contractor agreeing to make a weekly report as to the progress of the work.

Mr. Smythe's visit was made in the latter part of November. Just prior to his coming there had been a heavy snow fall, and in the vicinity of the mine the snow averaged a great depth. Mr. Jackson knew this. He started his tunnel, and instead of entering the mountain took an easterly course around the side under the snow. The mouth was closely timbered, but after a distance of 30 ft. the timbering was done in a less substantial manner, the contractor using 16-foot boards and 2x4 spiles. The track was laid in the same distance as the substantial timbering. A car or two of waste littered the roadway, and the appearance of a veritable tunnel presented. In the latter part of January Jackson sent to the superintendent word that the tunnel was completed. In due time Mr. Smythe arrived. Jackson conducted him to the entrance, gave him the end of a rope which was exactly 225 ft. long, and told him he need not soil his clothes, that the tunnel was very wet, and that when the end was reached he (Jackson) would strike the face with a hammer. This was done. Mr. Smythe expressed entire satisfaction with the work, paid Jackson the $3,500 remaining due, and released him from his contract. The superintendent then went East and made his report. He returned six months later, prepared to at once proceed with the development of the mine. His queries as to the meaning of the timbers around the mountain resulted in the discovery that he had been taken in. Jackson was last heard of in Tombstone, and the superintendent of the Silver King lode hasn't been heard from since.—*Avant Courier* (*Montana*).

Fossil Remains.—In mentioning the Indian Spring drift mine last week we said that fossil remains were occasionally found in the gravel. And now comes the report of the discovery of similar fossils in the Mineral Slide mine, some five or six miles distant from the Indian Spring works. In drifting some 400 or 500 feet below the surface of the ridge last week the workmen encountered what upon investigation proved to be the fossil remains of a mastodon or some other large animal. A portion of the remains has been shipped to Mr. LaMonte, of San Francisco. One piece sent below consisted of a portion of the jaw, and was about 18 inches in length. By careful work the men expect to unearth the remains entire. The animal, whatever it may be, appears to have been in an upright position, and the workmen had picked and shattered it considerably before they discovered what it was.—*Oroville Mercury*,

The smelting company's furnace completed its two hundredth carload of bullion, or 44,000 bars, on Saturday. This, at its market value, is worth in the neighborhood of $400,000, and when taken into consideration that it has been extracted from only one-half of the tailings of the Raymond & Ely ores, the other half remaining to be worked, a fair idea can be had of the productiveness of said properties before the owners became at loggerheads.—*Pioche Record*.

A large number of the "hardy prospectors" of New Mexico are engaged in making locations on empty beer kegs with the seat of their pantaloons.—*Hadley's Pointers*.

The Engineer.

A New Kind of Gas Engine.—Some of the London papers are quite enthusiastic over the new kind of gas engine which has recently been introduced there, among its advantages being a low consumption of gas, which can be regulated with great nicety according to the load on the engine—coal, petroleum, atmospheric water gas being also equally adapted. In its construction an oval-shaped iron casting of considerable thickness, cast in one piece with the cylinder, conceals the piston rod, connecting rod and crank, from view, and while imparting to the engine great firmness and steadiness, prevents the risk of accident. Regularity in working is also attained by the employment of a specially heavy fly wheel, and all parts of the engine being constructed to gauge, are therefore interchangeable and easy of adjustment. The working parts, which are few in number, are made of hardened steel, so as to secure the utmost durability and smoothness of motion. A turn or two of the fly wheel by hand will set the engine going, and a boy or laborer can attend to it, and it is, moreover, very compact and portable.

Underground Wires.—It has been claimed that there was an insuperable difficulty in putting electric wires under ground without injury to their working capacity. It is on this assumption that all our cities have been allowed to be disfigured with unsightly poles and the air darkened by a network of wires. It is now stated that experiments in working underground wires have been tried with such success in Philadelphia that the problem is considered as good as solved. If it is practicable to work electric wires under ground, other cities than Philadelphia will require telegraph, telephone and electric light companies to abate a nuisance that has been endured on the assumption that the business of the various companies depended upon its toleration. It is well known, however, that in Germany nearly all the telegraph wires in the country as well as in the cities are laid under ground. A New York contemporary says it is not a question so much of science as of dollars and cents.

The Severn Tunnel.—There appears to be some chance of this tunnel being at length completed, as there are now 2,300 men engaged on the work, and it is expected to be finished in 4 years' time. One hundred and twenty houses have been built and 50 others are being constructed for the use of the workmen. This tunnel, which will be the longest in England, is 4½ miles long and crosses underneath the river Severn about 16 miles from Bristol, 2½ miles being under water. The Great Western Railway Company, which is the promoter, will save 45 minutes in the journey from London to South Wales, and the ferry service at Bristol will also be dispensed with. The work was commenced 10 years ago by the Great Western Company itself and carried on by it until the works were flooded out, when, by the advice of Sir John Hawkshaw, it was handed over to the contractor, Mr. T. A. Walker. The tunnel will be 25 ft. wide, 25 ft. high, and will be bricked from end to end, the thickness of the walls varying from 2 to 3 ft.

Novel Bridge Engineering.—J. E. Smith, of Leicester, England, has suggested a novel method of building bridges either for temporary or permanent use, which seems to have many advantages both in simplicity and cheapness. Iron or steel cylinders, 20, 40 or more feet in diameter, constructed of plates riveted to rolled iron or steel ribs, are rolled into the stream over which it is desired to carry the bridge. These gigantic cylinders with half their diameters sunk under the water form so many arches upon which a level road can easily be thrown. The cylinders can be built upon the spot where they are required, or, filled in with a temporary floor at one end, can be readily floated to their destination. The system is expected to be useful in laying railroads across land subject to occasional flood.

Engineering Enterprise in Hamburg.—The Senate of Hamburg, Germany, has recently reported in an exchange, have had under consideration a scheme for constructing a tunnel under the Elbe and an elevated railway in that city. The construction of a bridge instead of a tunnel is said to be out of the question on account of the width and crowded state of the harbor, and the author of the project has designed the tunnel of such dimensions as would provide both for vehicles and foot passengers, and a double-track railway for freight and passengers. This he proposes to effect by building the tunnel of two stories, the road for vehicles and pedestrians to be in the upper story, and the line of railway in the lower story. The estimated cost of the tunnel and railway is $6,250,000, and they are to be completed in five and a half years.

Reclamation of the Zuyder Zee.—The preliminary surveys for the proposed reclamation of the Zuyder Zee have been finished, and the work of building the walls will soon begin. A dyke about 24½ miles in length will be constructed of sand and faced with clay, reaching 16 feet above the level of the sea, which will make it about 6½ feet above the highest tide. The thickness of the dyke will be such as to enable it to resist the heaviest sea. Operations will begin at four different points, and the calculation is to have it completed in from 7 to 10 years, at a cost of $46,000,000.

Useful Information.

Curious Patents.

Some investigating person has furnished the New York *Times* with a brief list of patents on small things which in many instances have proved great mines of wealth to the lucky discoverer. The list might be extended to a much larger number, but we only state those given in the *Times*. Among these trifles is the favorite toy—the "return ball"—a wooden ball with an elastic string attached, selling for 10 cents each, but yielding to its patentee an income equal to $50,000 a year. The rubber tip on the end of lead pencils affords the owner of the royalty an independent fortune. The inventor of the gummed newspaper wrapper is also a rich man. The gimlet-pointed screw has evolved more wealth than most silver mines, and the man who first thought of putting copper tips to children's shoes is as well off as if his father had left him $2,000,000 in United States bonds. Although roller skates are not so much used in countries where ice is abundant, in South America, especially in Brazil, they are very highly esteemed, and have yielded over $1,000,000 to their inventor; but he had to spend fully $125,000 in England alone fighting infringements. The "dancing Jim Crow," a toy, provides an annual income of $75,000 to its inventor, and the common needle-threader is worth $10,000 a year to the man who thought of it. The "drive well" was an invention of Colonel Green, whose troops during the war were in want of water. He conceived the notion of driving a two-inch tube into the ground until water was reached and then attaching a pump. This simple contrivance was patented after the war, and tens of thousands of farmers who have adopted it have been obliged to pay him a royalty, a moderate estimate of which is placed at $3,000,000. The spring window shade yields an income of $100,000 a year; the stylographic pen also brings in $100 000 yearly; the marking pen for shading in different colors, $100,000; rubber stamps the same. A very large fortune has been reaped by a Western miner, who, ten years since, invented a metal rivet or eyelet at each end of the mouth of coat and pants pockets to resist the strain caused by the carriage of pieces of ore and heavy tools.

Dyeing Leather.—In the glove trade the leather has hitherto always been dyed by brushing on the dyes by hand. The defects of this method are its slowness, the occurrence of large, soiled edges on the fleshy side, and, notwithstanding every care being taken, the uneven character of the dye produced. To avoid these, Joseph Kristen, of Brunn, has a process in which even dyeing is obtained by the application of centrifugal force. The skin to be dyed is fixed on the center of a horizontally rotating disk. The color is also fed on to the center, and by the rapid revolution of the disk is spread equally over the whole surface. The color is forced on to the disk by means of a pump, or it merely flows from a reservoir standing at a higher level. The excess of color driven off at the edges of the revolving disk is collected and used over again until the skin is fully dyed. To dye one skin by this method takes from 10 to 15 minutes. A single color pump may serve for at least five machines, which would require only one attendant, so that by the above arrangement one man could in 12 hours easily dye 150 skins, possessing great evenness of dye and free from spotting.

A New Lamp.—It is stated that a new lamp, combining gas and electricity, giving remarkable economic results, has been brought out. Some years ago gas burners were not uncommon which had a small piece of platinum foil arranged on the burner so as to be burned in the flame. When this was heated by a gas flame, it, by a regenerative action, heated the gas coming from the burner and caused an improvement of the light. In this new lamp it is stated that the burner is so arranged that a small current of electricity is passed through the platinum. The gas is first lighted, and this heats the platinum, the resistance of which is thus increased, so that a current which would, when the platinum is cold, be freely transmitted, now heats the platinum to incandescence, and this in turn heats the issuing gas to a very high temperature, so that a light equal to 30 candles is, it is said, obtained by the consumption of two cubic feet of gas per hour and a small electric current. If this is the case, the existing gas fittings can all be utilized, and a secondary battery of no great number of elements would supply the current needed.

Preservation of Lemon Juice.—An attentive observer says, after various experiments and a test of eight months exposure to the sun and heat of summer, he has come to the following conclusion: "Heating the juice or adding alcohol to the same would appear to be superfluous, as it is only necessary to filter it and keep it in sealed bottles; however, since filtration proceeds so very slowly, the best way is perhaps to add ten per cent. of alcohol to the fresh juice, and bottle. The *Pharmaceutical Journal* observes that it may be preserved without the addition of alcohol by heating it to 150° F., and then excluding it from the air by carefully closing the full bottles at this temperature. The operation should be carried out in winter."

How to Get Portraits of Burglars.—A correspondent of the *Scientific American* says: "We have evidently entered the age of electricity, and I offer the suggestion of a detective trap for burglars as among the important possibilities. The burglar alarm now in use, true to its name, alarms the burglar, and he is away. Instead of ringing the alarm, let it be set to turn on momentarily the full glare of the electric light, and at the same instant have it expose a plate in a camera all ready to take an instantaneous picture. The burglar, of course, will take to flight, but will leave his photograph behind. The same blaze of light which has alarmed him will awaken the sleeping inmates, who can at once proceed to the camera and secure the negative. In order, however, that the camera should be set at the right focus, the alarm used should be an electric mat set in a certain place on the floor, that spot being covered by the focus of the camera. In case of banks and safety deposit companies the electric mats should be in front of the iron safes.

Strength of Paper.—One of the most remarkable things about paper is its strength. As an illustration of this a note of the Bank of England twisted into a kind of rope can suspend as much as 329 lbs upon one end of it, and not be injured in the least. There is an article made of paper in the shape of a small kitchen or house truck on wheels used for wheeling loads around the house. The sides and bottom of this are made of finely compressed paper, and it is capable of bearing a weight of five tons. There are bath tubs and pots made in the same manner, by compressing the paper made out of linen fibers, which is painted over with a composition which becomes part of the paper and is fire proof. The tubs never leak, or may be put on the fire and will not burn. It is almost impossible to break them, as you can beat on them with a hammer and not injure them in the least.

Antiquity of Ropes.—Archæologists know that ropes date from a very remote period, and had reached a date of considerable perfection at the dawn of the historical era. The first ropes were probably made from the fibers of the inner bark of trees, from grasses, or from the hides of animals. Among the relics of the ancient Egyptians have been found sculptures showing the process of rope manufacture practiced more than 4,000 years ago, while the oldest records of that people represent well-made ropes capable of sustaining enormous burdens. It appears that flax and the fibers of the date tree were employed for those ropes.

Tea and Coffee Extracts.—An aqueous extract of tea, coffee, cocoa or ginger is made by boiling it for 15 minutes in water containing sulphate of lime in solution, then cooling to 60°, when a solution of tannic acid, previously boiled till nearly devoid of smell, is added. A precipitate occurs and is filtered out. It is then left to stand for a day, and an aqueous gelatine solution of three or four grains to the ounce of water is added in quantity nearly sufficient to precipitate all the tannic acid. The liquor still containing a little tannic acid is strained and bottled.

Good Health.

Relative Longevity in Various Occupations.

An interesting exhibit of the mortality in the different walks of life was furnished by the General Register in report on the death rate of the whole population of England in 1851. From this it appears that out of every thousand persons between the ages of 25 and 55, 40 died on an average. Classified according to the most favorable mortality, and increasing downward, we have the following tables:

Below the Average.	*Above the Average.*
1. Merchants.	7. Miners.
2. Weavers.	8. Tailors.
3. Cobblers.	9. Bakers.
4. Carpenters.	10. Butchers.
5. Blacksmiths.	11. Liquor dealers
6. Laborers.	

The mortality of the eleventh class is so great that in good insurance companies they are only admitted with great caution, and on short endowment or term policies.

Mariners also are considered poor risks, as 35% of the deaths among them are attributable to accidents; among miners, 25%; among machinists, 15%; and among painters, well-diggers and glaziers, 10% die in consequence of casualties. The callings of brewer, typesetter, tinsmith, lithographer and stonecutter are also in a measure detrimental to a prolonged duration of life.

Sleeping With the Mouth Open.—The only true way for one to sleep as regards the position of the mouth is to have it closed. Nature has designed the nostrils as the breathing passage for man and beast. If you will observe the animals around you, you will notice that when quiet the mouth is closed. Breathing with the mouth open not only introduces the air too abruptly to the lungs, but also affects the condition of the membranes of the mouth and alters the constitution of the secretions. One who sleeps with the mouth open generally awakens with a dry, parched, disagreeable sensation which does not wear away very quickly. —*Phrenological Journal.*

Poisonous Colors.—The German Government has just laid before the Reichstag the following decree, bearing date May 1, 1882, concerning the prohibition of poisonous colors for the coloring of certain alimentary substances and articles of food: 1. The use of poisonous colors for the manufacture of food products or articles of food intended for sale is prohibited. Those which contain the following materials or compositions are considered as poisonous colors within the meaning of this enactment: Antimony (oxide of antimony), arsenic, barium (except sulphate of baryta), lead, chromium (except pure chromic oxide); cadmium, copper, mercury (except cinnabar), zinc, tin, gamboge, picric acid. 2. The preserving and packing of food stuffs or food products intended for sale in wrappers colored with the above-cited poisonous colors, or in barrels in which the poisonous color is so employed that the poisonous coloring matter can pass into the contents of the barrel, is prohibited. 3. The employment of the poisonous colors enumerated in Article 1 is prohibited for the manufacture of playthings, with the exception of varnish and oil paints made of zinc-white and chrome-yellow (chromate of lead). 4. The use of colors prepared with arsenic for the manufacture of paper hangings, as well as that of pigments containing copper prepared with arsenic, and of matters containing similar colors for the manufacture of materials of dress, is prohibited. 5. The putting on sale, and the sale, wholesale or retail, of food stuffs and food products preserved or packed contrary to the regulations of Articles 1 and 2, as well as playthings, paper hangings and dress materials manufactured in contravention of the directions in Articles 3 and 4 are prohibited. 6. This law will come into operation on April 1, 1883.—*British Medical Journal.*

Be Good to Yourself.—Think deliberately of the house you live in, your body. Make up your mind firmly not to abuse it. Eat nothing that will hurt it, wear nothing that distorts or pains it. Do not overload it with victuals or drink or work. Give yourself regular and abundant sleep. Keep your body warm by clad. At the first signal of danger from any of the thousand enemies that surround you, defend yourself. Do not take cold, guard yourself against it; if you feel the first symptoms give yourself heroic treatment. Get into a fine glow of heat by exercise. Take a vigorous walk or run, then guard against a sudden attack of perspiration. This is the only body you will ever have in this world. A large share of pleasure and pain of life will come through the use you make of it. Study deeply and diligently the structure of it, the laws that should govern it, the pains and penalties that will surely follow a violation of every law of life or health.—*Oakland Tribune.*

The Treatment of Ringworm.—A writer in the *British Medical Journal* says: "The difficulty experienced in the treatment of ringworm is known to everyone who has seen much of this disease. I therefore think your readers will be glad to hear of a remedy which I recently used with complete success. Struck with the similarity that existed between the disease known in the East Indies as dobzitch, and ringworm, and knowing how rapidly the former yields to the application of goa powder, I was induced to try the active principle of this substance, chrysophanic acid, in the proportion of one dram to one ounce of vaseline. The result has been rapid destruction of the fungus, and consequently a complete cure. Chrysophanic acid has been recommended in the treatment of psoriasis, but I am not aware of its having been used hitherto for ringworm."

Vinigar for the Sick-Room.—There is a French legend that, during the plague at Marseilles, a band of robbers plundered the dying and the dead without injury to themselves. They were imprisoned, tried and condemned to die, but were pardoned on condition of disclosing the secret whereby they could ransack houses infected with the terrible scourge. They gave the following recipe, which makes a delicious and refreshing wash for the sick-room: Take of rosemary, wormwood, lavender, rue, sage and mint a large handful of each; place in a stone jar and turn over it one gallon of strong cider vinegar; cover closely and keep near the fire for four days; then strain and add one ounce of powdered camphor gum; bottle and keep tightly corked. It is very aromatic, cooling and refreshing in the sick-room, and is of great value to nurses.

Sure Cure for Corns.—A scientific journal says: "A. C., who has tried it, is authority for the following: Take one-fourth cup of strong vinegar, crumb finely into it some bread; let stand half an hour, or until it softens into a good poultice; then apply on retiring at night. In the morning the soreness will be gone and the corn can be picked out. If the corn is a very obstinate one, it may require two or more applications to effect a cure." Continued moisture for a reasonable length of time is all that is generally needed to place the most obstinate corn in a condition for being easily removed.

The Seat of Electricity.—M. Spring, of the Belgian Academy of Sciences, concludes that the seat of the electricity of storms is not, as generally admitted, in the moist region of the atmosphere, but in the cold and dry superstratum.

MINING AND SCIENTIFIC PRESS.

TABLE OF CONTENTS.

EDITORIALS—Shallow or Modern Placers; Galena Smelting Works; Mine Management, 401. The Denver Exposition—No. 18, 406. Passing Events; Lead and the Tariff; Copper from Mine Water; Speeding Devices for Stamp Mills; Academy of Sciences, 408. The Ciphon in Mining; Scientific Physiognomy, 409. Patents and Inventions; Notices of Recent Patents; Langrehr's Patent Lift Pump, 412.

ILLUSTRATIONS.—General Arrangement of Argentiferous Galena Smelting and Refining Works, 401. Ciphons, 409. Langrehr's "Rival" Pump, 412.

MECHANICAL PROGRESS.—Steel for Nail Making; The Effect of Machinery on Coal Production; Finishing Saws; Absorption of Moisture by Building Materials; Stopping Engines by Electricity; The Utilization of Smoke, 403.

SCIENTIFIC PROGRESS.—Oscillation of Land in the Glacial Period; Causes of Dry Zones; Transmission of Power on an Ordinary Telegraph Wire; What is the Comet Made of; Electrical Phenomena on Pike's Peak, 403.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Assessments, Meetings and Dividends, 404.

MINING SUMMARY from the various counties of California, Nevada, Arizona, Colorado, Idaho, Oregon and Utah, 404-5.

NEWS IN BRIEF, on page 412 and other pages.

THE ENGINEER.—A New Kind of Gas Engine; Underground Wires; The Severn Tunnel; Novel Bridge Engineering; Engineering Enterprise in Hamburg; Reclamation of the Zuyder Zee, 407.

USEFUL INFORMATION.—Curious Patents; Dyeing Leather; A New Lamp; Preservation of Lemon Juice; How to get Portraits of Burglars; Strength of Paper; Antiquity of Ropes; Tea and Coffee Extracts, 407.

GOOD HEALTH.—Relative Longevity in Various Occupations; Sleeping with the Mouth Open; Poisonous Colors; Be Good to Yourself; The Treatment of Ringworm; Vinegar for the Sick-room; Sure Cure for Corns; The Seat of Electricity, 407.

CORRESPONDENCE.—Notes from Eureka, 409.

MISCELLANEOUS.—Blackburn District, Idaho; The Mechanical Properties of Aluminum; Concentration; Demand for Mines; Molecular Structure of Metals; Water Power for the Idaho Mine; Campbell Process, 402 Gravel at Big Bend, Rogue River; A Novel Tunnel, 406.

Business Announcements.

Mines Wanted—A. M. Lawrer, San Francisco.
Artificial Limbs—Chas M. Evans, Cincinnati, O.

Passing Events.

The Christmas holidays, now upon us, form a season of rest and recreation which we all enjoy. The mutual interchange of good will and good wishes generally indulged in at this time freshens our natures and lessens our cares, and the hearty "Merry Christmas and Happy New Year" greeting is pleasant to all. This week, however, brings care to the dilatory miner who has neglected to do his assessment work, and for some days yet vigorous blows of pick and drill must be given to bring the procrastinator on the right side of the law.

A number of new mining enterprises in El Dorado county are announced. The new demands for water, it is expected, will be more than the capacity of the ditches of the California water company.

New silver mines are reported near Mount Raymond, some 12 miles from Big Tree Station, in Mariposa county.

The strike in old White Pine district is in a place which will cause renewed exertions of the miners who were about to abandon work at the time the new find came to light. The ore deposit is 1,700 ft. below the surface.

SONOMA has a find in the shape of a petrified forest. It is upon the ranch of N. T. Hudson, and was found by the nephew of Mr. Hudson while hunting.

Lead and the Tariff.

The market prics of lead has declined so much that the lead producing camps have felt the effects. Utah is now the great lead producing center of this country, but Colorado and Idaho yield a good deal of the metal. But Utah is more interested in it than any other, and the miners there have lately formed the "Utah Mine Protective Association against the reduction of tariff on lead." The mine, furnace and mill owners, and other business men of Utah whose interests are connected with the prosperity of mining industries, met at the Walker house, in Salt Lake City, on the 9th of December, 1882, to discuss the proposed reductions of the tariff on lead and lead ores, and organized the association with the following officers and executive committee: Governor Eli H. Murray, President; F. W. Billing, L. E. Holden, James Sharp, W. S. McCormick, Geo. M. Scott, R. C. Chambers, H. C. Hill, John S. Scott, E. P. Ferry, as Executive Committee; J. E. Dooly, Treasurer, and A. Zeehandelaar, Secretary. Professor L. E. Holden was elected delegate to Washington, D. C., to represent the interests of the mining industries in Utah, and prevent the proposed reduction of the tariff on lead and lead ores. The association instructed Governor Eli H. Murray, as President of the Utah Mine Protective Association, and as Governor of the Territory, to invite all the lead producing States and Territories, through their respective Governors, to form similar protective associations and to send delegates to Washington to co-operate with Prof. Holden in protecting the common interest.

The following is a comparative statement of the value of lead bullion, including silver and gold necessarily produced in its manufacture west of the Missouri river, compiled from the annual reports issued by John J. Valentine, general superintendent of Wells, Fargo & Co., San Francisco:

YEAR.	Total value of precious metals, including lead.	Total value of lead bullion, including gold and silver contents	Per cent. of entire product.
1878.....	$81,154 622	$14,740,681	18 1-10
1879.....	75,349,501	19,234 3-4	25 5-10
1880.....	80,167,936	28,114,564	35
1881.....	84,504,417	30,253,430	35 8-10
Total.....	$321,176,476	$92,342,969	28 7-10

The present duty on English lead is five cents, which it is proposed to reduce to four and one-half cents. On lead made of Spanish ore the duty is six cents, which it is proposed to reduce to five cents. The Association makes the following showing for Utah: "That we have vast mines filled with ores, the history of our products for the last seven years fully proves. We have produced 22½% of all the lead produced in the United States. With the high price of coke, the long haul to market necessitating heavy freights, it is certain that not one pound of this lead could have been mined and sent to market but for the tariff of two cents per pound on lead and one and a half cents on lead ores. This Territory has produced from its mines and correlative industries over eighty millions of money since the mines were first opened, and given employment to thousands of men, and made a home market for all the produce which our farmers had to spare. Utah, Idaho, Montana, Nevada, Arizona and Colorado may be said to constitute the great mineral center of the continent, and by their location their products must be subject to heavy freight charges to the market. The mines are great consumers of iron and steel, and use immense amounts of machinery. They are the cause for vast consumption of coal and coke, and in Utah much of the coke used is from Pennsylvania. Without the tariff not a mine or furnace producing lead ores or bullion could compete with the Spanish mines, they having cheap labor and water transportation. The very life of these great industries is in the tariff.

WORKING LOW-GRADE ORES AT A PROFIT.—The annual reports of the Sierra Buttes and Plumas-Eureka mines, California, both now owned by English companies, give some interesting figures in showing that ores of low-grade can be worked at a margin of good profit. The Sierra-Buttes mine produced for the year 19,437 tons of quartz, mined at a cost of $4.10 per ton, and milled at 60 cents per ton, making the average working expenses $4.70 per ton. The average yield of the ore in free gold was $6.47, and, with the tailings, $7.06 per ton. The yield of the Plumas-Eureka was 29,555 tons. The cost of mining, $3.10 per ton, and milling 48 cents per ton, or a total of $3.58 per ton. The average yield of the ore in free gold was $6.88 per ton.

PRICES FOR ORE.—In order to encourage the development of prospects in Tombstone mining district, the Head Center Consolidated Mining Co. gives the following prices in cash for ore if the same is delivered alongside of a fair wagon road anywhere within three miles of the courthouse in Tombstone: For $30 ore the company will give $6.00 per ton; for $35 ore, $7.50 per ton; $40 ore, $10.00 per ton; $45 ore, $13 50 per ton; $50 ore, 17.00 per ton; $75 ore, $35.00 per ton; $100 ore, $53.00 per ton. The value of the ore is determined by battery samples. The example of this company might be followed in other places with advantage, though higher prices would be realized for ore elsewhere.

Copper from Mine Water.

The name of cement copper is applied to the copper deposited from the water of certain mines when such is brought in contact with plates of iron. We have seen a pick, crowbar and an old shovel left in the water at the bottom of the shaft of a copper mine taken out covered with a fine deposit of this kind of copper. Of course there are many mines where it would not pay to pass the water over iron to save the copper in solution; but sometimes it does pay to do so. In Europe the water is thus utilized. Thus the water of the Almwich mine, of Angelsea, and the mines of Wicklow, Schmolnitz, etc., contain cupreous sulphate in solution, and for the extraction of its copper the water is conveyed into pits or tanks containing scrap iron or iron plates. The water that has fallen on exposed heaps of copper ores, as well as the water pumped from the mines, is utilized in this operation; and the vats or tanks, which are about 100 ft. long, with corrugated or furrowed bottoms, are partially filled with old iron, such as tin-plate chippings, and are arranged in terrace form, so that the water flows into the top or head pit, from which it is drawn off after the necessary interval into the second tank, and so on to the end of the series, the number of vats comprised in the series depending on the quantity of water and the amount of copper it contains.

The water is finally drawn off at the end of ten weeks, and the deposited matter is well washed with the water remaining in the hollows or corrugation of the vats, while the mud or schlich obtained is passed into pits where it settles into slimes which, when stiff, are placed on the top of the reverberatory furnace for drying, after which it is passed through sieves and then melted. The precipitated matter on the floore of the first four pits or vats is put together as the best, while that from the middle six vats form the second quality, and that collected from the remaining vats contains only about five per cent. of metallic copper, and constitutes the lowest class. In this process, in addition to the copper, an ochreous product is obtained, containing ferric, oxide, etc., along with some copper, and which is sold as an ochre. The copper obtained by this process is very pure, possessing a high degree of malleability and ductility.

In treating the water by another method the water from the mine passes along an inclined channel or trough, across which, at intervals, are introduced plates of iron over which the waters flow and deposit the copper from the cupreous sulphate held in solution by the waters, the trough being intercepted at intervals with deep tanks for the deposition of precipitated matter. By still another method the water is pumped into a series of precipitating vessels in which cast iron plates are arranged like lattice work, the deposition of metallic copper and ferruginous matters occurring in the manner already described.

Speeding Device for Stamp Mills.

With stamp mills constructed in the ordinary manner it is impossible to run the stamps over a certain speed. Mr. Wm. B. Upton, of this city, has this week received, through the MINING AND SCIENTIFIC PRESS Patent Agency, a patent for a device which is intended to overcome this difficulty and render it possible to run stamp mills at a greater rate of speed than at present.

In order to do this, two tappets are put on the stamp-stem, one for the cam and one below for an arm to impinge upon. The horizontal arm has a roller affixed to its end, and this arm intervenes between the cam and the secondary tappet, the arm being journaled loosely upon a horizontal shaft. A screw-stem extends downward from the rear end of this arm, carrying nuts and elastic buffers, by which adjustment and the proper action of the roller are effected. The stamp-stems, stamps, cams, etc., are arranged in the usual manner. As ordinarily constructed, the maximum speed obtained is about 90 drops a minute. This rate of operation is due to the gravity of the stamp alone. This inventor concludes, therefore, that when he adds to the force of gravity the power of the revolving cam for a positive downward throw, he can obtain a quicker drop, and the upper tappet can be more quickly placed to be again raised by the cam.

The horizontal arm to which we have referred, and which is the feature of the invention, has a roller on its end, and this roller rests on the top of the lower tappet. Just as the upper arm of the cam leaves the upper tappet the lower arm of the same tappet strikes this roller, and through it acts on the lower tappet and the stamp stem, and starts the stamp down. As the action of the cam upon the upper or usual tappet is such as to cause the stamp to revolve in the usual manner, this movement is communicated to the roller on the horizontal arm, so that it turns in the proper direction to offer the least resistance to the action of the lower cam arm.

The arm to which the roller is journaled extends back horizontally a short distance, and to the rear end are fixed plates and elastic buffers. There are also screw threads, etc., by which the buffer can be compressed to any desired extent. The position of the arm and roller can also be changed to allow the tappet to be raised or lowered on the stem when desired.

In effect, when the cam has lifted the stamp by the tappet to its fullest hight, the lower arm of the same cam just at the proper time acts on the lower or supplemental tappet to give the stamp a downward throw so as to increase its speed, thus allowing a higher rate of speed to be given to the cam-shaft so as to speed the whole mill.

Academy of Sciences.

Dr. Behr presided at the regular meeting of the California Academy of Sciences which was held last Monday evening. Wm. R. Eckert, S. B. Leavitt, J. F. Houghton, F. Lamberghtini and Dr. Paolo Vecchi were proposed for membership.

Dr. H. W. Harkness read a list of 15 new species of fungi parasites on vegetation. He also presented for inspection the jawbone of a mastodon which was found in a tunnel in Butte county 1,400 ft. in and 600 ft. below the surface. A feature of this was that in one of the teeth was seen a small piece of gold—the first instance of the exemplification of prehistoric dentistry on record.

Dr. Henry Gibbons, Sr., made some interesting remarks on the recent meteorological conditions, showing the concurrent action of the higher and lower strata of clouds in the formation of rain clouds. He had observed that our rains frequently commenced with high clouds moving from the northwest, which is accompanied by a southerly lower current. He said it was very important to better predict the weather, and studious investigations to this end were well undertaken.

Dr. Harkness had also observed that clouds coming from northwest had acted as rain-carriers. He thought the observation and study of the upper strata should be more thorough than it was at present.

Charles Wolcott Brooks exhibited a rain-hand spectroscope, invented by Professor Piazzi Smyth, Astronomer Royal for Scotland. When rain is to be expected dark lines appear between the yellow and orange shades of the prism, which indicates the amount of rain to be expected in proportion to their intensity.

George C. Hickox, on behalf of the committee appointed to nominate officers of the Academy for the ensuing year, submitted the following as the "Regular Ticket:" President, George Davidson; First Vice-President, Justin P. Moore; Second Vice-President, H. Herman Behr; Corresponding Secretary, Samuel B. Christy; Recording Secretary, Charles G. Yale; Treasurer, Elisha Brooks; Librarian, Carlos Troyer; Director of the Museum, William G. W. Harford; Trustees—Charles F. Crocker, William Ashburner, George E. Gray, Thomas P. Madden, Ralph C. Harrison, Louis Gerstle and James M. McDonald. The President appointed Charles Wolcott Brooks and Charles D. Gibbs, Judges of Election; also, W. F. Myers and Albert Kellogg, M. D., Inspectors of Election.

The Publication Committee reported through the Secretary that all the papers on the subject of the Carson Footprints had been published with the appropriate engravings. Copies of the papers were distributed to members.

DOES MINING PAY?—Under this caption the Black Hills *Pioneer* says that some persons, arguing from the standpoint of the money that has been sunk, gold and silver mining does not pay. That paper comprehends the situation differently, and apprehends that gold being the standard of values, it will be readily seen that if every dollar taken from the earth costs one dollar, the world is one dollar richer. Without the dollar expended the additional dollar could never have been a factor in the wealth of the country. Supposing that every dollar produced cost two dollars, there has been a definite gain of 50 per cent. Something has been produced out of what was practically nothing, and the production is one that will not wear out like woolen or cotton fabrics, or even like iron and coal. It is almost indestructible, and can always and under all circumstances be made available. Even should every dollar of gold or silver that is produced from the earth cost four dollars, there will be found to have been a profit of 25 per cent. on the outlay, so far as the world is concerned.

A COMPANY of Eastern capitalists have commenced mining on a large scale at Mule creek, Amador county. The claim is gravel, and there is no fall for dumping. The pay gravel lies about 25 ft. below the surface, which latter is to be removed with scrapers operated by horse power. That is a novel way to get rid of top dirt. The gravel must be very rich to pay.

A MONTANA paper says: It is stated that John Longmaid paid out for freight over the Union Pacific over $100,000 for the transportation of concentrated ore since last spring. Almost the entire value of the ore was thus used up in paying freight.

Notes From Eureka, Nevada.

[From our Correspondent.]

Some News From White Pine.

I am pleased to learn that Treasure hill, White Pine county, once famous for its rich dividend-paying mines, is again coming to the front. The Ehrhardt and Aurora tunnel is in 6,000 ft. from the mouth. It has been driven through an almost entire limestone formation, a belt of slate shale dividing it nearly midway in the tunnel being the only positive change of formation occurring. The limestone in places is silicified, and in others it is dolomitic. At the breast of the tunnel is a crosscut which, commencing, runs southerly, and curving, terminates to the westward at a point where a seam of ore 6 or 8 inches thick was struck. A drift has been run 100 ft. each way, northerly and southerly on the vein, following ore all the way. About 80 ft. from the south end of the drift it has a thickness of two ft., or a little more. A raise on the ledge at this point, 15 or 20 ft. above the tunnel level, and a winze sunk a few ft. below it, shows the vein to be permanent and well defined. There has been 25 or 30 tons of ore extracted, giving very satisfactory assays, and from appearances might work at least $300 per ton. Its character is chloride, but contains a little base, not sufficient, however, to prevent its reduction by milling process. The spot where the ore was first struck is about 1 600 ft. below the surface, which is sufficient evidence that all theories heretofore advanced in regard to the non-existence of ore in limestone formations at great depth are erroneous. There is no reason why this vein should not be followed to the surface, and also to a great depth below the tunnel level. That it is a regular fissure vein is evidenced by the striations and attritions in the casing. The formation on each side of the ore is hard silicious limestone. On the foot-wall is a layer of clay about two or three inches thick. The vein strikes north and south, and dips with a slight inclination to the east. At the face of the drift, south end, the vein gives promise of widening. Several samples of the ore have been brought to Eureka by Mr. W. Jay Smith, by whose courtesy I have come in possession of this information. He examined the property in company with Captain Frank Drake, the superintendent, and his sensible views I take as evidence of practical experience. He says that the big Smoky Valley mill has been overhauled and thoroughly renovated. Ten stamps are running to full capacity on ore from the Sweetwater Co.'s mines on Chloride Flat, and from the Truckee mine, the latter at present showing an abundance of high-grade ore. I visited

The Eureka Tunnel

To-day, where there is still a gradual improvement. The south drift from main tunnel towards the El Dorado No. 2 shaft has advanced 50 ft. on the contract, and is in very favorable ground for ore. The winze from new north drift is down 65 ft. from tunnel level, and has intersected the east chamber, where the ore still holds out, and the ventilation is now good. The north stope looks well, the ore running from one to three ft. thick at the extreme end, which is probably 40 ft. from the line of the tunnel. The best looking portion of the mine is around and about the bottom of the south winze from the 105-ft. level, whence the ore makes off in every direction, from one to six ft. in thickness, undulating like the waves. If a hoisting engine is placed on the main shaft or winze I do not doubt that from 10 to 12 tons of ore per day could be hoisted, but at present the waste dirt cannot be removed fast enough to allow it.

The Red Bird Tunnel

Is in 33 ft., and a shaft is to be sunk from this point to intersect the ledge which dips rather flat from the surface. In the west drift from the Golden Rule tunnel six ft. of very hard blue lime has been passed through during the week, and soft, sandy limestone, with small chunks of quartz all through it, is now coming in in the face. A decided change for the better. There are three men working at the Banner mine, one of them taking out a ton and a half of ore per day. There are about 25 tons on the dump. The Dead Broke mine is being well prospected. There must be over two miles of openings in the mine, with more or less ore in nearly all of them. The "Lizzie L" series adjoining is looking well, but as a prospect only. Some men are working under lease. Considerable work is being done in drifting, cross-cutting and upraising, with very excellent indications everywhere, and low-grade ore in two or three places. Yours truly, M. H. Joseph.

A Lucky Accident.—The Grand Victory mine, which has been running the past few months under a lease to W. Knights, was last week sub-leased to other parties. Mr. Knights closed down to make his last clean-up, when it was discovered that one of the plates was loose. Upon being taken up for the purpose of repairing it, it was found that more or less sediment had found its way under the plate, and closer investigation showed that a large percentage of it was gold. This discovery led to the taking up of all the plates, and a thorough clean-up under, as well as the top of the plates, and to his great surprise and pleasure the under side gave a clean-up of $2,000. This accident may possibly be of benefit to others.—*Republican.*

The Siphon in Mining.

Last week we gave an engraving showing the principle of operation of the siphon, which, although a familiar thing to many, is not so to all. Moreover, it was intended to make some further remarks in connection with the subject, more particularly as to the use of the siphon in mines. A siphon will not work unless the delivery is below the feed, and unless the pipes and joints are perfectly tight. If the line is not regular, as shown in Fig. 1 or Fig. 2, but irregular, as shown in Fig. 3, air collects at the high places, and the siphon ceases work. In constructing siphons the first consideration is that the pipes and joints should be such as to prevent inward leakage of air, otherwise the appliance is useless. Then it should be laid as regularly as possible, either horizontally or inclined, as already stated, because if irregular, as shown in an exaggerated form on Fig. 3, air which cannot be prevented entering along with the water will lodge at the higher points, as shown shaded, and destroy the action. Of course, such a defect might partially be remedied by inserting a vertical pipe at each of these points but it is better not to need them. Provision will have to be made for charging a siphon at the commencement, and occasionally when so much air has entered as to injure if not stop the work. To do this a tap is placed at the delivery end, to be opened and closed by hand, and a light clack placed in the pipe at the feed end. This clack will open and keep open when the siphon is at work and close when the tap is shut at the other end, thus keeping the siphon charged. Such a clack is not needed at all in the actual working; indeed, should be open the whole time, and if too heavy or carelessly made, will do harm. The idea is to keep the appliance charged when working has ceased. A pipe is inserted at the highest point, or nearly so, of the siphon, for the double purpose of charging and allowing air to escape.

FIG. 1.—EFFECTIVE SIPHON PLACED LEVEL.

FIG. 2.—EFFECTIVE SIPHON, REGULAR INCLINATION.

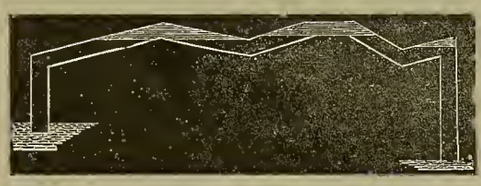

FIG. 3.—DEFECTIVE FORM OF SIPHON.

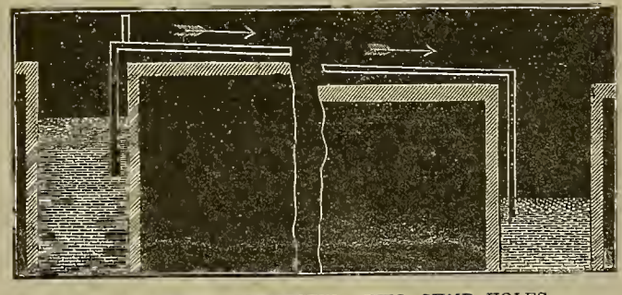

FIG. 4.—SIPHON CONNECTING TWO SUMP HOLES.

It is not often that all the water in a mine will flow of itself to one point where the pump is fixed. Sometimes water is made at a lower point than the main pump, and if so, must be dealt with by a small pump or pumps, or hauled out in tubs. At other times the water is made at a high enough point to fall to the main pump by gravitation, but high ground intervenes, and a drain cannot be out with the same convenience in a mine as on the surface. Also, water may collect in both pump holes, and the pump only connects to one. In such circumstances that very useful appliance, the siphon, comes into operation. (See Fig. 4.)

In addition to using the siphon between sump-holes and other parts of mines, Mr. C. M. Perry, from whom we quote, relates that he found it of good service on at least two special occasions. One was during a fire which had broken out underground in the neighborhood of the furnaces, and a stream of water was laid on from a reservoir on the surface. It was considered undesirable to cut through the reservoir bank, and the siphon enabled the water to be obtained from the reservoir over the bank. During this use of the siphon an interesting practical proof was obtained of the inertia of water hursting pipes. Almost every time the water was turned off suddenly one or more pipes burst, owing to the sudden check upon the flow of the water. But when turned off gradually no damage was done. The other case was wanting to empty, or nearly so, a large and deep reservoir without cutting through the bank, the overflow being of course much too high. Again the siphon answered the purpose, and delivered the water into a drain passing through some low-lying land. A siphon has its maximum efficiency when the hight the water has to rise is a minimum and the vertical fall not less than the atmospheric column—34 ft. In such a case the theoretic velocity would be obtained from the formula velocity in feet per second squared = twice gravitation × height in feet, or = 64 × 34 = 2,176, square root of which would be about 46½ ft. per second. This is the maximum velocity, and would be reduced by friction dependent on length and size of siphon. For other cases the effective hight could never be more than 34 ft., minus the hight the water had to rise, and this would still further be reduced by the extent that the length of the shorter leg was less than 34 ft.

Debris as Fire-Proof Cement.—The slickens from the hydraulic mines has at last been found at least good for one thing. It makes an excellent fire-proof cement. A few years ago some plasterers at Marysville run out of lime while building a furnace at the water works, and as an experiment the slickens was used as a cement, and is to-day still holding the bricks of the furnace. It is said to be much firmer than lime cement, and absolutely fire-proof. Is it probable that some enterprising man will go to work manufacturing slickens cement as a regular business?

Scientific Physiognomy.

Writers and students from the earliest time of intellectual research have devoted more or less study to the relations which exist between the human mind and face. But little real progress, however, was made in this direction until Lavater published his well-known work upon the subject in 1758. This book created quite a sensation in the learned world, and really paved the way to the still more important researches of Gall and Spurzheim. The earlier writers sought to read character by the face only; Lavater included the forehead in his researches, while Gall and Spurzheim carried the subject still further, embracing the entire cranium in their discussion, and thus laid the foundation for a new science—phrenology. Sir Charles Bell subsequently announced still further discoveries, and showed that intimate relations existed between the mind and the physiological development of the entire human system. Darwin next assumed prominence in this study, and in 1872 published the result of his observations, confirming the wide connection between the mind and body so ably set forth by Bell. These later views have also been developed or endorsed by many other scientists, among whom may be mentioned Maudsley, Spencer, Lewes and others.

A San Francisco Book.

About a year since another quite important addition was made to this interesting field of scientific research by the publication in this city of a work entitled "How to Read Faces." This title seems to be rather misleading, and gives a comparatively narrow view to the real character of the work, which has been written by Mrs. Mary Olmstead Stanton, wife of Mr. A. P. Stanton, business manager of the *Argonaut*, of this city. The book takes quite a wide range of discussion, and embraces everything practical and really useful in the whole subject of physiognomy and phrenology. It should have received a more descriptive title, and is worthy of more than mere passing attention. The subject of physiognomy, which, as usually treated, is dull and tedious to the general reader, is here presented with a freshness and piquancy that at once interests and attracts and keeps up the interest to the end of the 350 pages which comprise the volume, even with those who are not specially inclined to the study of this science. The book is copiously and judiciously illustrated, and contains many original propositions well sustained by facts and arguments in addition to the comprehensive statement of those already generally received.

The author sustains the proposition that the "mind adheres in the entire organization, and that the brain is only one source of the mind"—that the mind has its seat not only in the brain, but in the viscera, muscles, bones and general nervous ganglia as well. This is the view now entertained by Herbert Spencer, Geo. H. Lewes, Ernest Haeckle, Dr. Maudsley, Dr. J. L. Lindsey, and indeed by all the present most advanced students of mind and physiology.

The author very properly holds that man's knowledge of himself has not kept pace with his researches into his surroundings, and that the time has fully arrived when man should strive to study and know more in regard to himself—how to improve his faculties and his capacities; how better to protect and improve his bodily and intellectual powers; how to prevent and remedy the diseases which assail him, etc. This class of information is of far more importance than many of the studies upon which much valuable time is spent, both in youth and after-life, without really advancing, to any considerable degree, his most important interests. This information can come only through a knowledge of anatomy, physiology, physiognomy and hygienic care properly applied. To impress upon the mind of the general reader these important facts, and to enable him to start out in this new and interesting study has been the object of the author of this work; hence she has endeavored to frame her language in as simple a manner as possible, and to divest it of everything which might tend to confuse or discourage the non-scientific reader. We regard this work as a valuable addition to this class of literature. It is a book which should find its way into every family. It may be read and studied by all, both young and old. For sale by all newsdealers and at the book stores generally.

A Bonanza of Bones.—A gentleman who is exploring the wilds of Montana and Idaho writes that not far from Custer's battle-ground, on the Little Horn river, is a place where are to be found regular drifts of petrified wood and bones of extinct animals. There are to be seen great numbers of petrified logs, with one end buried in the side of the bluff and the other protruding out and breaking off in blocks. He says: Some of these are three feet in diameter, with each year's growth plainly visible in the grain. In the same bluff are tusks of the Mesageatherium as large around as a man's body, which are likewise imbedded at one end and breaking off into blocks at the other. The porous inside under the enameled surface is unmistakable proof that they are bones. Both the trees and the tusks are as black as coal at the exposed ends, but gray in color where covered by the hill.

CHICAGO **FRASER & CHALMERS.** ILLINOIS

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

HOISTING ENGINES

Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin for Giant and Old Abe Co., Black Hills also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars. McCaskell's Patent Car Wheels and Axles—Best in Use.

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.

Redlands.

Good water, rich soil and magnificent view. High elevation, dry air, few fogs and northers.

No brush or fences on the land, which is especially adapted to the culture of the orange and raisin grape.

Near to church, school, store and depot. Hotel open. Telephone Communication.

Stage from San Bernardino Tuesdays, Thursdays and Saturdays.

SEND FOR CIRCULAR.

JUDSON & BROWN,

Redlands,

SAN BERNARDINO, CALIFORNIA.

Carson and Colorado Railroad.

(NARROW-GAUGE.)

The Company announces the completion of its line March 1, 1882, to CANDELARIA, Columbus Mining District, Esmeralda Co., Nev., 158 miles from Mound House (Junction with Virginia and Truckee Railroad).

STAGE CONNECTIONS,

At Hawthorne with U. S. Stage Company's daily coaches for Aurora (26 m.); Bodie (37 m.); Lundy and Bridgeport.

At Luning (125 miles from Mound House) with Gilmer, Salisbury & Co.'s tri-weekly stages (leaving Tuesday, Thursday and Saturday mornings) for Grantsville, Belmont and Tybo.

At Belleville (150 miles from Mound House) with Belleville and Independence Stage Co.'s stages for Benton (40 m.), Bishop Creek, Big Pine and Independence.

At Candelaria, with U. S. Stage Co.'s stages for Columbus (8 m.), Silver Peak, Montezuma, Alida Valley, Gold Mountain, etc.

THROUGH TICKETS

To the above points for sale at San Francisco, Sacramento Reno, Carson and Virginia R. R. Ticket offices.

This is the direct and natural route for Passengers and Freight, to points in Southern Nevada, Mono and Inyo counties, California. The line, laid with steel rails and redwood ties and equipped with new and first-class rolling stock, is penetrating new and most promising Mining Districts which are now attracting deserved attention throughout the country.

For information on through freight rates apply to

H. M. YERINGTON, Gen'l Supt. D. A. BENDER, Gen'l Freight & Pass. Agent Carson, Nev.

PACIFIC POWER CO.

Room with steam power to let in the Pacific Power Co.'s new brick building, Stevenson street, near Market. Elevator in building. Apply at the Company's office, 314 California street.

SULPHURETS.

Clean Concentrations wanted. A party from the East having a process for working low-grade Sulphurets, will commence purchasing the same as soon as assured of an abundant supply. Gold-bearing Sulphurets preferred, having an assay value of $20 per ton, or upwards. Address,

A. B. WATT, P. O. Box, 2293, San Francisco.

THE MOREY & SPERRY MINING MACHINERY CO.

Successors to MOREY & SPERRY,

Manufacturers of all kinds of

MINING MACHINERY.

Gold and Silver Grinding, Concentrating and Amalgamating Machinery, Engines and Boilers of any size. Hydraulic Giants, Hydraulic Outfits. All the various kinds of Amalgamating Pans, Combination, Eclipse, Excelsior, etc. Settlers, Rock Breakers. Stamp Mills for Wet or Dry Crushing. Howland's Pulverizer, Improved Riffles, Retorts for Gold and Silver, Silver Plated Copper for free Gold Amalgamation. Hoisting and Pumping Machinery, Chloridizing Furnaces, etc. Mining and Mill Supplies of every description. Steel Shoes and Dies that last three times as long as any iron.

WAREROOMS: 92 & 94 Liberty St., New York,

Foundry and Machine Shop: Newburg, N. Y.

NOTICE.—The public and former friends and patrons of the old firm of **Morey & Sperry** are hereby notified that the above-named Company is the legitimate and ONLY successor to the said firm, having acquired all the drawings, patterns and machinery of the of the old firm, together with the lease and good will of its business.

We shall continue the business, with largely increased facilities, at the old place, having made connection with the Newburg Steam Engine works, which have been enlarged to meet the demands of this Company. Mr. Franklin Morey, of the late firm of **Morey & Sperry**, will manage the business of this Company. Information and estimates of the various styles of Mining and Milling Machinery cheerfully given. All orders filled promptly. Materials and Workmanship First-Class.

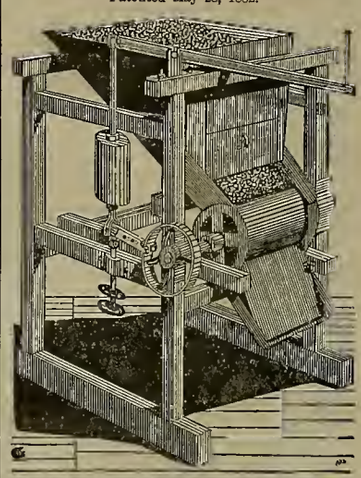
THE ROLLER ORE FEEDER.

Patented May 23, 1882.



This is the best and cheapest Ore Feeder now in use.

It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery, as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252, Market St., S. F.

FOR WEEK ENDING DECEMBER 2I, 1882.

268,860.—CHIMNEY—J. Browell, S. F.
268,870.—COMBINED FRAME AND PLAQUE—Amos Currier, S. F.
268,903.—WING GATE FOR FLUSHING SEWERS—Samuel Johnson, S. F.
268,916.—RAILWAY SIGNAL—G. Macquart, Red Bluff, Cal.
268,931.—JUMPING ROPE—Fred. K. Pohley, S. F.
269 124.—AUTOMATIC TELEGRAPH SIGNAL BOX — Paul Seifer, S. F.
268,950.—FRUIT PICKER—L. Simkins, Marshfield, Or.
268 953.—GIRTH—Alonzo W. Smith, Cana, Cal.
268,960.—CIGAR PERFORATOR—John Talhot, Sacramento, Cal.
268,963.—SPEEDING DEVICE FOR STAMP MILLS—Wm. B. Upton, S. F.
268,977.—DRESSING MACHINE—H. B. Angell, S. F.
268,928.—RAIL COUPLING AND BED PLATE—John Ney, Sheridan, Cal.
268,898.—EVENER HINGE FOR HARNESS—Wm. A. Howard, Dixon, Cal.
269,092.—ELECTRIC LOCOMOTIVE—E. J. Molera, S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co. in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

EVENER-HINGE FOR HARROWS.—William A. Howard, Dixon, Cal. No. 268,898. Dated Dec. 12, 1882. This invention relates to a new and useful evener-hinge which is especially adapted for section harrows. The object of the invention is to furnish a connection between the evener and any number of independent sections of a harrow, whereby each section may vibrate freely without the employment of side hinges, and at the same time each may be readily raised to be cleaned without interfering with the others. Harrows are usually constructed of a number of sections independent of each other to a certain extent. The evener is usually clipped by links to the front center of each section. If this were the only connection each section would have too great play, and its vibration as it dragged along over clods, etc., would frequently be so great as to cause damage to the other sections. To provide for this a link connection of various descriptions is made between two sections along their adjoining sides. This keeps each to a limit of vibration, but is objectionable from the fact that it not only limits side movement, but end movement as well, and thereby prevents the section from being raised to be cleaned, as it requires considerable strength to raise the whole harrow. This invention limits the side movement of the sections, and yet allows each to be raised independently of the others.

GIRTH.—Alonzo W. Smith, Cana, Cal. No. 268,953. Dated Dec. 12, 1882. This invention relates to a new and useful girth and hook for pack-saddles, and it consists in an ordinary pack-girth having at one end a wooden roll to secure the rope and at the other a peculiar link to receive the hook, which said hook is provided with a friction roller or spool. The present form of pack-girth is provided at one end with a ring secured by a leather strap, and has at the other end an ordinary hook secured likewise. The rope passes from the ring over the pack on the horse's back and down on the other side to the hook, around which it passes and is secured. It has been found by experience that there are two serious objections to this form of girth and hook. In the first place the rope, in passing around the hook, must necessarily be drawn tight, and such great friction is caused thereby when the pack begins to work that in the course of a short time the strands wear and the rope breaks. In the second place the hook in one end and the ring in the other, by being secured as they are now done, soon wear the straps and pull out from the girth. The object of this invention is to overcome these difficulties by providing an anti-friction hook, and by securing it and the rope in such a manner as will subject the girth to the least wear.

DREDGING MACHINE.—Horace B. Angell, San Francisco; assignor one-half to Thomas H. Williams and David Bixler. No. 268,977. Dated Dec. 12, 1882. This is an improvement on the dredger which has been doing such effective work in the tule lands of this State, where it has been at work for some time. So satisfactory is the record of this machine that the Panama Canal Company is having its dredgers built in this city on the same plan, the machinery being shipped to its destination from here. This particular patent covers certain details of construction which would be difficult to describe without the aid of somewhat elaborate engravings. It covers a means of cleansing and assisting the discharge of the buckets, a means of advancing the scow and apparatus, and maintaining a straight line, and a few other things.

CHIMNEY.—Jeremiah Browell, S. F., Cal. No. 268,860. Dated Dec. 12, 1882. This invention relates to certain improvements in the construction of chimneys, and is especially applicable to double or sectional chimneys. The inventor constructs a double chimney having the inner smoke flue composed of sections with joint bands surrounding said sections and having curved elastic stays connected with them and pressing against the interior of the outer section. This inventor has taken out numerous patents for chimneys, and has made a specialty of their construction. The condensation of the warm air and gases within the chimney flue causes a deposit of moisture within, and this causes the soot to stick and clog and fill up the flue. Mr. Browell prevents this by coating the interior of the flue or chimney with black lead or a mixture thereof, which presents a smooth surface to which the carbon will not adhere, and this keeps the chimney always clear and in good order.

WING GATE FOR FLUSHING SEWERS.—Samuel Johnson, San Francisco. No. 268,903. Dated Dec. 12, 1882. This invention relates to what is called as a "wing gate" for flushing sewers, and it consists of an adjustable gate of peculiar construction, hinged at points so that it may be folded to be introduced into the sewer through the manhole, and having connected with it a means for securing it at any desired point. This gate is used to carry out a system for flushing or cleansing sewers, in which this gate may be fixed in any sewer where there is a heavy flow of water, so as to divert the stream into a branch or side sewer which opens into the first one, and by this means cleanse it.

RAIL COUPLING AND BED-PLATE.—John Ney, Sheridan, Cal. No. 268,928. Dated December 12, 1882. This invention relates to a novel rail coupling and bed-plate for railways, and it consists in a peculiar cap fitting over the meeting ends or joints of the rails and bolted down to a peculiar jointed bed-plate, the whole device being spiked to the ties below. The object of this invention is to provide a coupling of sufficient stiffness to form a bridge over the joints when the ends of the rails sink, this stiffness being the result not only of the peculiar cap, but of the bed-plate to which it is bolted.

CIGAR PERFORATOR.—John Talhot, Sacramento, Cal. No. 268,960. Dated Dec. 12, 1882. This is a device for perforating the tips of cigars, so as to provide a draft through the cigar without cutting off the end, and it consists of a pair of semi-conical jaws hinged together, so that they may be opened and closed by handles or otherwise. Within these jaws are a series of projecting pins, which, when the end of the cigar is inserted and the jaws closed, will perforate the cigar tip transversely.

JUMPING ROPE.—Frederick Pohley, San Francisco, Cal. No. 268,931. Dated Dec. 12, 1882. This invention relates to a novel attachment for skipping ropes, and it consists of handles or attachments having bells or chimes fixed to them, and surrounded by a perforated protecting case, so that when used the bells may ring or give a musical sound to keep time to the movements in skipping.

THE Derbec Co. have run, it is said, 2,200 ft. of tunnel in eight months—275 ft. a month—9½ ft. a day for every day.

FOR aged men, women, weak and sickly children, without a rival. Will not cause headache. Brown's Iron Bitters.

Pacific Coast Weather for the Week.

[Furnished for publication in the PRESS by NELSON GOROM, Sergt. Signal Service Corps, U. S. A.]

*Reports missing.

Langrehr's Patent Lift Pump.

We illustrate on this page the "Rival" patent lift pump for marine, mining and agricultural purposes, manufactured by Henry C. Langrehr & Co., 25 Market St., in this city. This pump is designed for vessels, sewers, cesspools, and all places where a good, low-priced, large, easy working and durable pump is required. It is compact, strong and effective. It has simple valves, without the usual working box in a cylinder. There is but little wear, tear or friction. The operating cylinder is of brass; it is durable, acting in its delivery, which gives a steady stream.

It pumps water from vessels with very little effort, and never is out of order by being clogged. It is the thing needed to pump muddy and dirty water, coarse dust, sand, grain, etc. For cleaning out cesspools the pump is capable of drawing up not only water, but also the ordinary sediment which collects. It has been awarded the medal in the Mechanics' Institute for the best ship pump on the Pacific coast. The same pump can be changed into a force pump in a simple manner and in a short time. There are no rubbers or chambers or bolts to wear out. For draining shallow workings or surfaces cuts in mines it is very effective, owing to its great capacity.

The space occupied by the pump is 18x18 inches. No skilled mechanic is needed to keep it in order, all the working parts being free and in open sight. It can be observed instantaneously without delay. This pump is arranged so as to have a very powerful leverage, and one man can accomplish a great deal of work with it on this account. Instead of having a

LANGREHR'S "RIVAL" PUMP.

long stroke and small cylinder or barrel, it has a short stroke and very large valve. It is adapted not only for ships, mines and for agricultural purposes, but also for paper mills, tanneries, railroads, chemical or gas works, breweries, wells, sewers, etc.

ARTIFICIAL LIMBS.—Those persons who are unfortunate enough to need artificial limbs are nevertheless fortunate to be living in an age when such things are so skillfully made as to nearly fill the requirements of a natural limb. Charles M. Evans, of Cincinnati, Ohio, manufacturer for the United States Government, has had many years' experience in furnishing artificial limbs, and stands at the head of manufacturers of such articles.

THE range of country lying between the western limits of Manitoba and the eastern boundary of British Columbia has been divided into four territorial divisions, named Assiniboia, Saskatchewan, Alberta and Athabaska. New post-offices have been established.

A TRUE assistant to nature in restoring the system to perfect health, thus enabling it to resist disease, is Brown's Iron Bitters.

News in Brief.

A LONGFELLOW Memorial Association has been organized in San Francisco.

GOV. STANFORD denies that he ever thought of selling his Nob Hill residence.

THE New York *Sun* says Edison's electric light is a failure because it is too dear.

EPIZOOTIC has broken out in the stable of the Camden Transfer Co., at Philadelphia.

THE famous Mrs. Langtry, the English "professional beauty," is coming to California.

THE rains have ceased in Oregon, the floods are subsiding, and travel is being resumed.

FIVE hundred seats were sold in the new National Petroleum Exchange, which opened at New York the other day.

MARTIN BURGER and Nelson Pierce have been appointed inspectors of foreign steam vessels for the port of San Francisco.

THERE are probably more gunners abroad in California (on Sundays) than in any State of the Union during the hunting season.

THE Archbishop of Quebec has warned the faithful not to accept invitations for the Masonic hall in honor of the Grand Lodge.

EVERY dealer in Pendleton, Oregon, was indicted for violating the Sunday law, pleaded guilty, and was fined $10 each and costs.

THE HAYES FIRE TRUCK.—We learn with interest that the Hayes fire truck, which is a California invention designed by D. D. Hayes, of San Francisco, is achieving great success. It is now being manufactured by the La France Fire Engine Co., of Elmira, N. Y. An order has just been received from London, England. It is pronounced the leading automatic in modern fire apparatus. The demand bids fair to be universal. E A. Scott & Co., of Sacramento, are sole agents for the Pacific coast.

No Whiskey!

BROWN'S IRON BITTERS is one of the very few tonic medicines that are not composed mostly of alcohol or whiskey, thus becoming a fruitful source of intemperance by promoting a desire for rum.

BROWN'S IRON BITTERS is guaranteed to be a non-intoxicating stimulant, and it will, in nearly every case, take the place of all liquor, and at the same time absolutely kill the desire for whiskey and other intoxicating beverages.

Rev. G. W. RICE, editor of the *American Christian Review*, says of Brown's Iron Bitters:

Cin., O., Nov. 16, 1881.
Gents:—The foolish wasting of vital force in business, pleasure, and vicious indulgence of our people, makes your preparation a necessity; and if applied, will save hundreds who resort to saloons for temporary recuperation.

BROWN'S IRON BITTERS has been thoroughly tested for dyspepsia, indigestion, biliousness, weakness, debility, overwork, rheumatism, neuralgia, consumption, liver complaints, kidney troubles, &c., and it never fails to render speedy and permanent relief.

MINES WANTED.

Two Gold, one Copper and one Antimony, for CASH CUSTOMERS. Mines will be as good as sold if first-class and accompanied with favorable Reports from Experts of known reputation. No PROSPECTS wanted, and no mine without an Expert Report will be entertained. Apply in person or by letter to

WATER JACKET SMELTING FURNACES

—FOR—

Galena Silver & Copper Ores.

The PACIFIC WATER JACKET SMELTERS embrace many features that are entirely new and of great practical utility, which are covered by letters patent.

No other furnaces can compare with these for durability and in capacity for uninterrupted work.

MORE THAN SIXTY of them are now running on the Pacific Coast, giving results never before obtained as regards continuous running, economy of fuel, grade and quality of bullion produced. We are prepared to demonstrate by facts the claims here made.

These Smelters are shipped in a complete state, requiring no brick or stone work, except that for the crucible, thus saving great expense and loss of time in construction.

Complete smelting plants made to order of any capacity and with all the improvements that experience has suggested as valuable in this class of machinery. Skilled and experienced smelters furnished when desired to examine mines and to superintend construction and running of furnaces. Estimates given upon application.

Send for circular.

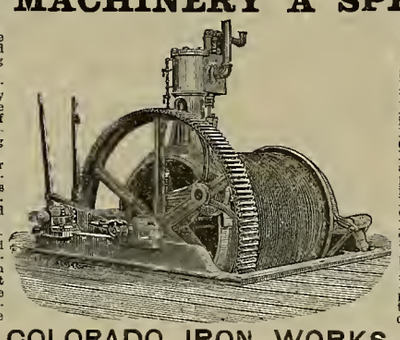
MINING MACHINERY A SPECIALTY.

Our manufactures of mining machinery embrace every kind of machine and appliance for the mining and reduction of ores.

We have had an experience of more than twenty years in the manufacture and practical operation of mining machinery in Colorado and the neighboring States and Territories.

Our facilities are superior to those of any manufactory in the West, our works having been recently rebuilt, greatly enlarged and completely equipped.

We invite the investigation of mine owners and mill men seeking machinery. We can furnish, on board, at our works, or set up at the mines anywhere in the Rocky Mountain region, on short notice, the following machinery: Cornish Pumps, Steam Pumps, Stamp Mills for Wet or Dry crushing, Pans, Settlers, Agitators, Retorts, Bullion and Ingot Moulds, Reverberatory Furnaces, Bruckner Cylinders, Revolving Roasting Furnaces and Dryers, Melting Furnaces, Concentrating Machinery, Rolls, Crushers, Conveyors and Elevators, Ore Samplers and Grinders, Hoisting Engines, Water Jacket Furnaces, Slag Pots and Cars, Lead Pots and Ladles, Blast Pipes and Water Tuyeres, Blowers, Cupellation Furnaces, Market Kettles, Wire Rope, Cages, Buckets, Skips, Ore Cars, etc. Estimates furnished and prices quoted on application. Send for illustrated catalogue.



COLORADO IRON WORKS,

P. O. Box, 1921, - - - - Denver, Colorado.

STEEL CASTINGS

FROM 1-4 TO 10,000 lbs. WEIGHT.

True to pattern, sound and solid, of unequaled strength, toughness and durability.

An invaluable substitute for forgings or cast-iron requiring three-fold strength.

Gearing of all kinds, Shoes, Dies, Hammerheads, Crossheads for Locomotives, etc.

15,000 Crank Shafts and 10,000 Gear Wheels of this Steel now running prove its superiority over other Steel Castings.

CRANK SHAFTS, SHOES, DIES and GEARING specialties.

Builders of Steam Machinery

IN ALL ITS BRANCHES,

Steamboat, Steamship, Land

Engines and Boilers,

HIGH PRESSURE OR COMPOUND.

STEAM VESSELS, of all kinds, built complete with Hulls of Wood, Iron or Composite.

ORDINARY ENGINES compounded when advisable.

STEAM LAUNCHES, Barges and Steam Tugs constructed with reference to the Trade in which they are to be employed. Speed, tonnage and draft of water guaranteed.

STEAM BOILERS. Particular attention given to the quality of the material and workmanship, and none but first-class work produced.

SUGAR MILLS AND SUGAR-MAKING MACHINERY made after the most approved plans. Also, all Boiler Iron Work connected therewith.

WATER PIPE, of Boiler or Sheet Iron, of any size made in suitable lengths for connecting together, or sheets rolled, punched, and packed for shipment ready to be riveted on the ground.

HYDRAULIC RIVETING. Boiler Work and Water Pipe made by this establishment, riveted by Hydraulic Riveting Machinery, that quality of work being far superior to hand work.

SHIP WORK. Ship and Steam Capstans, Steam Winches, Air and Circulating Pumps, made after the most approved plans.

PUMPS. Direct Acting Pumps, for Irrigation or City Water Works purposes, built with the celebrated Davy Valve Motion, superior to any other Pump.

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valvee at any epeed. Perfcct delivery of the air at any epecd or presecure. The heating of the air entirely prevented at any presecure. Takee lese water to cool the air than any other Compressor.

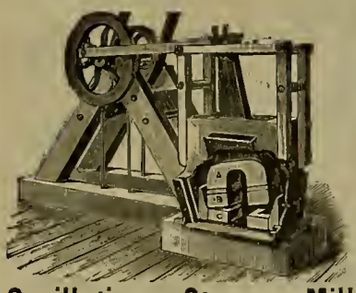
Power applied to the beet advantage. Access obtainable to all the valvee by removing air chest covers. Entire abeencc of epringe or friction to open or ehut the valvee. No valve etems to break and drop ineide of cylindere.

Have no back or front heade to break. The only Machinc that makee a perfect diagram. No expeneive foundatione required. Absolute economy in firet coet and after working.

DISPLACEMENTS in air cylinder perfect. Showing lece leakage and friction thau our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

MILL AND MINING MACHINERY.



Oscillating Stamp Mill.

It has no Steins, Cams, or Tappets, and adjusts itself to the wear of the Shoes and Dies.

For simplicity, economy, durability and effective working, it exceeds anything ever presented to the public, and will do the work of five stamps with one-fourth the power. Awarded First Premium and Medal at Mechanics' Fair, S. F., 1880.

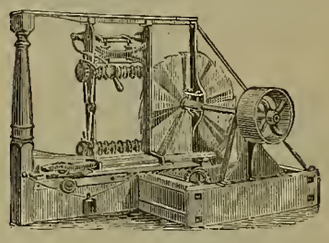
PATTEN'S CONCENTRATOR.

This machine requires less power, less care or attention, and is less liable to get out of repair than any concentrator now in use. All of which any practical miner will comprehend when seeing it in operation.

The wear and tear is nominal, and the construction so simple that any miner can put it up and run it; and the low price brings it within the reach of all mill men, as it will save enough to pay for itself in any mill in a very short time. One machine will concentrate the tailings from a five-stamp battery.

☞ Send for Circulars. ☜



SHINGLE MACHINE.

For simplicity, durability and rapidity of action, these Machines have no equal, cutting from 3,000 to 4,000 per hour. They are now used by all the principal Millmen on the Pacific Coast.

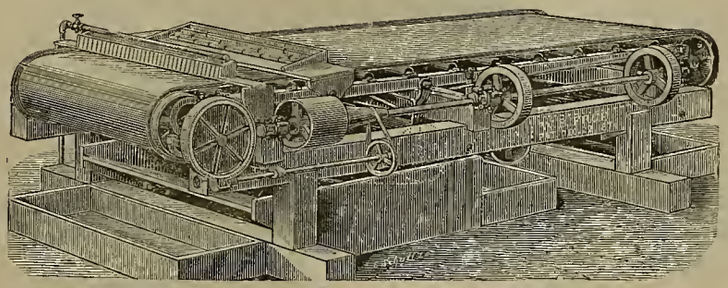
$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR,

—OR—

VANNING MACHINE.

Over 400 are now in use, giving entire satisfaction. Saves from 40 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal.

A machine can be seen in working order, and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont Street.

To those intending to manufacture or purchase the so-called "Triumph" Concentrator, we herewith state:

That legal advice has been given that *all shaking motion* applied to an *endless traveling* belt used for concentration of ores is an infringement on patents held and owned by the Frue Vanning Machine Company.

That suit has been commenced in New York against an end-shake machine similar to the Triumph, and that as soon as decision is reached in the courts there, proceedings will be taken against all Western infringements.

That the patent laws make *users* of infringements responsible as well as makers, and the public is therefore warned that there is considerable risk in purchasing any end-shake machine until our various patents have been decided.

That if there are those who for any reason prefer an end-shake machine, we can manufacture and sell to such a machine of that description, as efficient as the Triumph, and at a lower price, and no liability for infringement will then be incurred by the purchaser.

That we shall protect ourselves against any one making, selling or using any machine infringing any of our patents. Patented July 9, 1867; May 4, 1869; Dec 22, 1874; Sept. 2, 1879; April 27, 1880. Patents applied for.

That we are, and have been, ready at any time, to make a competitive trial against the Triumph, or any other machine, for stakes of $1 000.

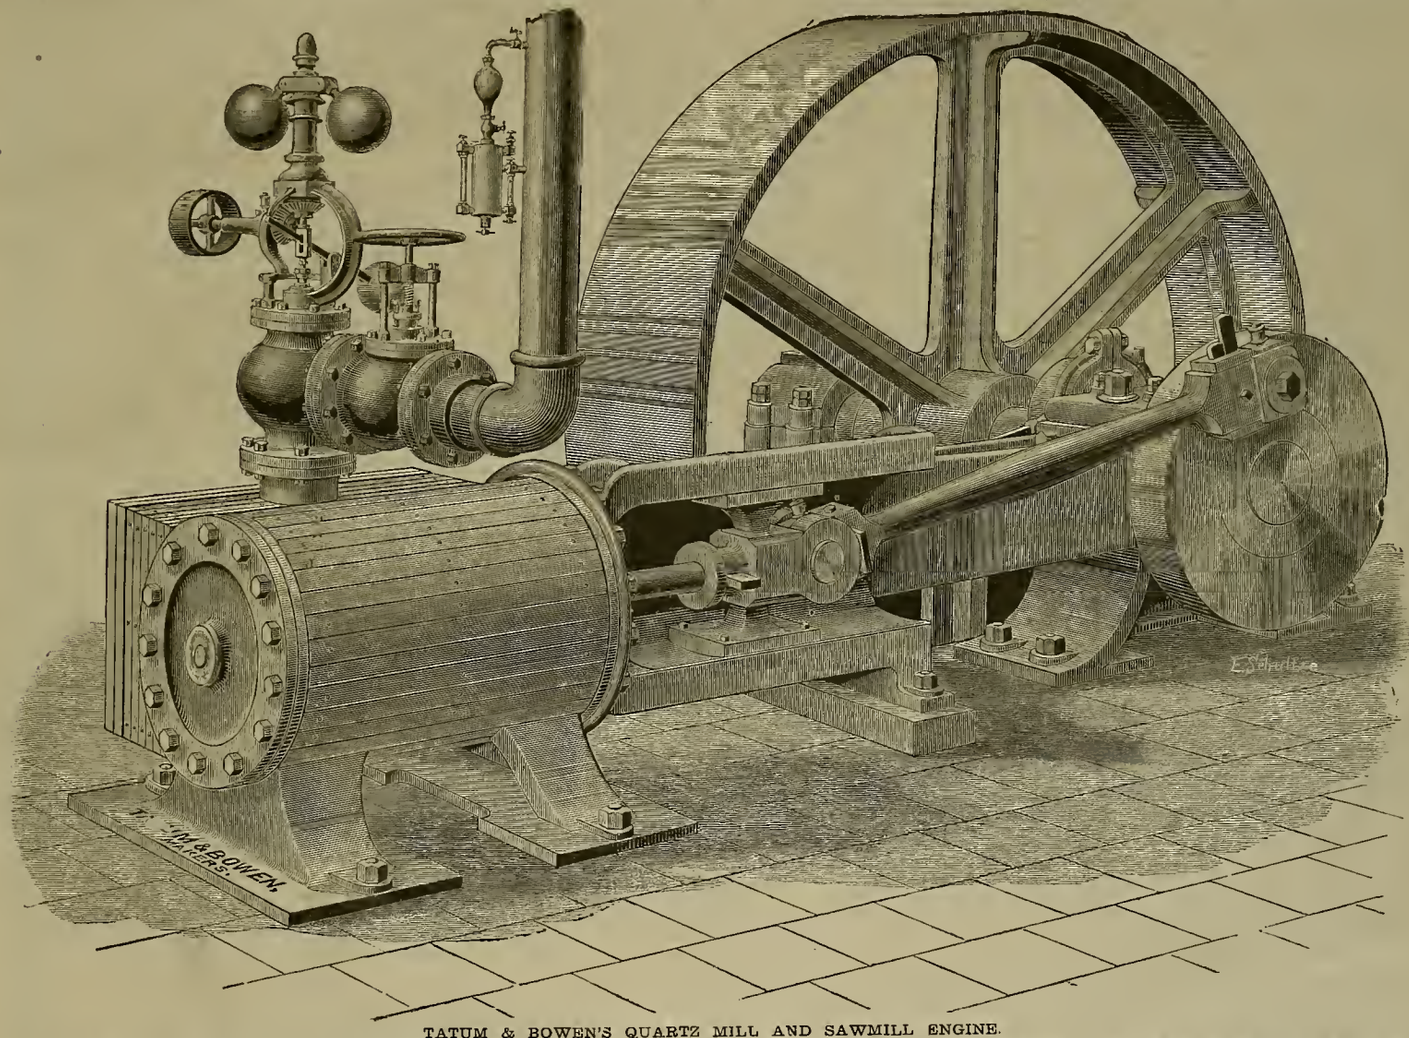
MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers. SAN FRANCISCO, SATURDAY, DECEMBER 30, 1882. VOLUME XLV Number 27

A Progressing Establishment.

The well-known firm of Tatnm & Bowen, who have been for some time at No. 12 California St., have movsd into more commodions and convenisnt quartes at Nos. 25, 27, 29 and 31 Main St. in the line large hnilding just completsd by the Cntting Packing Co., Tatum & Bowen's lease for 10 years aggregating $57,000, a snm which they coneider very reasonahle, as the location is attracting the heavy hnsiness of the city, and



TATUM & BOWEN'S QUARTZ MILL AND SAWMILL ENGINE.

rents in the neighhorhood have douhled within the last year, with every probability of further increase.

Numher 25 is devoted to the husiness of their lubricating oils, Alhany luhricating compound, cylinder oil, etc., goods which have a world-wide reputation. This department is nnder the immediate supervision of Mr. John Morris, who is well and favorahly known to our machine users.

Numher 27 is the Hoe printing press and Johnson type department, and will he under the menagement of Mr. S. P. Smiley, assisted hy Mr. W. E. Loy, gentlemen who are old friends of every newspaper man and printer on the coast. It is nnnecessary to say anything as to the superiority of the Hoe press. The *Chronicle*, *Call*, and in fact all first-class offices here, as well as elsewhere, are provided with them. Among others, the extsnsive lahel and lithogreph house of M. Schmidt & Co. have purchased them from Mesere. Tatnm & Bowen to the value of $40,000. The Johnson type is too well known to require further mention.

Numhers 29 and 31 are fitted np with a 125 horse-power engine and boilers, and with the moet improved machinery for ths mennfaotnre of their specialties in the line of Pacific coast saw mill machinery. In this the firm have no competition, as they own the patents of Mr. J. A. Rohh, who for many years devoted his time and talent to the production of special machines which alone are adapted to the mammoth timher of this Coast. This mechinery is so much heavier and hetter than that ueed in Eastern mills, thet Eastern mill meu, on seeing it, invariahly inquire as to the purpose for which it is intended. They are incredulous as to the sizs of onr timher—which dwarfs theirs into pipe stems. They have no conception of a tree that will turn out 100,000 ft. As our timher is eo immeasurahly larger than theirs, so must our machinery he more massive, and, as a natural consequence, must combine ingenions contrivances which are ahsolntely necessary in order that it may he operated with accuracy and celerity.

After many years of experimenting and hard work the machines are a snccessful rsality, as is demonstrated hy the fact that almost every mill on the coast, large and small, has more or less of them; while the firm have hnilt, nnder contract, many of the largest mills in the conntry. They are now engaged in the conetruction of eeveral, among others the Mammoth mill of Messrs. Hanson & Co., at Tacoma, W. T. This mill is 440 ft. long hy 50 ft. wide—is all constructed of iron, and filled with the latest improved machinery. Its capacity will hs, when hnishsd, some 200,000 ft. of lumher per day. It is lighted hy electric machines, and is altogether the largest lumher mill in the world.

This department of Messrs. Tatum & Bowen's business is under the superintendence of Mr. J. A. Rohh himself, which is equivelent to saying that it will he intelligently and skillfnlly management of Mr. Levi Booth, formerly chief engineer of the Savage mine at Virginia City. They are agents for the celehrated Hoe chisel tooth saw, the Ball patsnt valve engine, the Detroit Luhricetor, Scheiren's New York helts, etc.

A epecialty is made of heavy Corliss-hed engines for quartz mill or saw mill work. One of these engines is illnstrated on this page. The engines of this type hnilt in the East are of too light frames for the work they are made to do here, so Messrs. Tatum & Bowen manufacture them in this city with unnsually heavy hsds and frames. They are made of any desired sizs, and are adapted to any class of work. More work is expected from engines on this coast than anywhere, and therefore they have to he heavily made.

This firm is one which has very rapidly increased its bnsiness during a few years, and with its improved facilities and excellent reputation it will, no donht, continue to progress stsadily.

ASSESSMENTS falling delinqnent in Decemher amount to $612,387, levied hy 32 mines, making a total assesment list for 1882 of $7,663,548, against $9,385,160 in 1881. Of this year's assesments, Nevada mines called for $5,463,925, and California mines for $1,540,964.

THE extension of the railroad systems into the mining regions of this coast, and particularly into Arizona and New Mexico, has hrought many copper propsrties into notice.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

Notes From Eureka, Nevada.

[From our Correspondent.]

The northwestern slope of Ruby hill, on what was formerly a desolate hillside, has sprung up

A Camp Full of Life

And vigor. Here the Albion smelting works and furnaces have been erected, and nothing of the kind in this district is so conveniently arranged.

The former is equipped with 40-horse power double cylinder engine, two boilers, one 48 inches, the other 54 inches in diameter, and a 36-inch Lewellen condenser. This machine has lately been thoroughly overhauled and the pipes covered with asbestos.

As the ore is hoisted out of the mine it is run on to the scales in cars and weighed. It is then run out over the dump on a track the distance of about 100 ft. to the top flow of the furnaces, which is on a level with the top of the shaft. Here it is dumped into the bins made to receive it. A rock breaker is so arranged that ore may be shoveled into it, and as fast as broken it falls into a separate bin. On this floor is also a sampling room, with complete sampling outfit, and a charcoal slide that discharges the charcoal on to the next floor below close to the domes of the furnaces. The ore on this, the middle floor, is discharged from the binson into a car which is rolled over a short track and dumped beside the charcoal, where both ore and charcoal are fed to the furnaces as required.

The Furnaces

Are Bishee & Williams' galena smelters. They have a nominal daily smelting capacity of 30 tons each, but under full blast may be made to smelt 50 tons each per day. There are two Westinghouse blowers used to supply the draft, which are run by small upright engines that are supplied with steam from the boilers in the hoisting works by means of iron pipe laid underground. At present that furnace is laid up for repairs, the bottom having been taken out to be replaced by a new and better one. No. 2 is running splendidly, and on Monday last turned out 152 bars of bullion of 110 lbs. each. But little speiss comes from the ore smelted, the iron nearly all running to slag. The latter, in large quantities, is wheeled back on to the feeding floor to be used for fluxing the ores.

The boiler from the Price and Davis shaft is being set in a building adjoining the furnace on the bottom floor, so that in case it becomes necessary to shut off steam from the boilers in the hoisting works, this may be used in place of them.

A track is to be laid along in front of the furnaces to and in front of the old ore bins used before the furnaces were erected, and which is at present full of ore, held in reserve should anything go wrong with the hoisting machinery. From this track is to be an incline hoist to raise the ore from the old bins and the slag to the feed floor of the furnaces, when the tedious process of wheeling will be done away with. This hoisting will be done by a friction wheel and gearing attached to the present hoist. It will be so arranged that both hoists can be run at the same time or not, as desired.

The Flue Dust Tunnels.

Referred to in a former letter to the MINING AND SCIENTIFIC PRESS, have been completed. There are five of them, each 100 ft. long, each one running parallel with the other. They are all connected at both ends by cross tunnels. Doors are so arranged that the smoke and duet can be forced through any desired passage in them to the flues. These are situated, one juet inside the entrance of No. 1 tunnel, and the other at the inner end of No. 3. They are square built. The first is six by six feet at the base, and stands 40 ft. high above ground. The other is the same size at the base, but is built up from the tunnel level through vertical spraiee, a distance of 50 or 60 ft. to the surface, and from there when completed will be 50 ft. to the top. Smokestacks attached to the domes of the furnaces are supplied with traps that may be opened or shut as desired. Upcast flues are connected with these which run into a similar tubing that lays flat along the ridges of the roof of the building. This in turn is connected with the downcast that enters the No. 1 flue at the base. In this flue are two heavy sheet iron traps which may be so arranged as to let the smoke and dust pass directly through it or force the same through the chambers so that the dust may settle on the bottom of them instead of passing with the smoke up through and out of the flues. At the base of No. 1 flue is a chute connected with a short tunnel underneath. Into the latter the dust will eventually be cast, and from there it will be taken, mixed with clay, and then fed with the ore into the furnaces to be resmelted. As the duet carries from $30 to $40 worth of the precious metals to every ton, the saving now made will soon pay for the extraordinary cost of material and construction to save it. In the rear end of and above the top floor of the furnace building is a charcoal bin built to hold 55,000 bushels, and further up the hill is another one calculated to hold 30,000 bushels, both of which are kept full, or nearly so. A small room has been built for use of the charcoal receiver close to the bins.

The water supply is good. Nine tanks have been set up, with a total holding capacity of 90,000 gallons. At the Uncle Sam shaft timbers are being framed for a carpenter's shop and engine-room. The building will be 54 ft. long by 35 ft. wide. In this a small engine will be set up for the purposes of running a scroll saw for cutting mining timber and lowering the same down through the shaft into the mine.

Between the furnace building and hoisting works is a

Machine and Blacksmith Shop

Twenty-eight by fourteen feet. The machine shop is heated by steam and equipped with an engine lathe, a water trap to separate steam from water, heavy machine bench, tinner's bench, and all the tools necessary. Henry Griffin, the chief engineer, an ingenious workman, is getting up a new style reversible oscillating engine, six by eight inch cylinder, for running the shop machinery. The blacksmith's shop is a model of neatness and convenience. It contains a brick forge with well arranged tuyeres, and a flue of sheet iron that slides up and down within another flue of the same pattern. The advantage of this is, when the blacksmith leaves the shop he can pull the inner flue down and cover the fire completely with it.

North of the hoisting works is the blacksmith's shop, where all the rough work is done. This is a building 18x30 ft., equipped with a regular mine blacksmith's outfit. Attached to this building is a carriage shed, and beyond it is the assay office building, 24 ft. long by 12 ft. wide, divided into two rooms—the assay office and chemical laboratory.

Other Buildings.

To the rear of these is an addition five feet in width, running the full length of the building, used as a sample and storage room. The assay office is furnished with a good melting furnace, muffler, and general outfit. The laboratory is not yet furnished. Next comes the company's office and clerk's residence, a square building 24x24 ft., containing four rooms, comfortably fitted. Necessary outbuildings, a commodious etable below the dump, and a powder magazine cut into the hill, out of the reach of or danger from fire, completee the list of improvements, all but a chain of roads graded out along the hillside in such shape as to reach every building with facility. Any person may acquire the privilege of building or making improvements on the company'sground, provided certain rules laid down, mainly with reference to the roads, are complied with. Already has an enterprising individual built a hotel and bar-room, the finest on Ruby Hill. He has also built a beautiful lodging-house for the head smelter, assayer and assistant, and has now under construction two rows of rooms to be fitted up as lodgings for the miners and furnace hands. A two-story brick store building with stone cellar underneath, 45 ft. long by 22 feet wide in the clear, is being erected, which, when completed, will add to the general appearance of stability that surrounds the growing little town. There are a number of cabins being built in the neighborhood, and it is expected that a postoffice will shortly be established. Yours truly,

M. H. JOSEPH.

Shasta County Mines.

A Good But Neglected Mining Region.

EDITORS PRESS:—Although I read your paper regularly and see mining notes from almost everywhere, I seldom see anything from Shasta county. Why is it, Mr. Editor? Are there no mines in this county worthy a passing word in your paper, or is there no one here capable of sending you a few items, or is it that we are all too shiftless and fossilized and lacking in energy and enterprise to care to let the world know of our resources and possibilities? It seems, sir, that some one should take this county and brush off the dust and cobwebs of stagnation and show the moneyed men of San Francisco that they need not go to the ends of the world to find a safe investment for their money with quick and large returns on the investment.

If the mineral wealth of Shasta county was situated in some barren, sun-burnt desert of Arizona, where timber and water were unknown, and the murderous Apachee numerous, the craze and excitement that would be raised would cause almost untold millions of money to flow in, only to be absorbed in the great expense incident to such unapproachable places. But laying right here at your door, so to speak, of quick and easy access, cheap transportation, with plenty of timber and water, and a good, healthy climate, is one of the richest mineral sections on this coast, lying almost idle just for the want of a little capital.

I am well aware of the prejudice existing against Shasta county among quartz miners. Our ledges do not go down, they say. Why, sir, who has ever been down to prove that assertion? I don't know of a mine in Shasta county that has been explored to any great depth.

It is a well known fact that Shasta county was one of the richest counties in the State in surface mining, and much of the gold was quartz gold. It is also well known that there has been a large number of rich quartz ledges found, and are being worked in a limited way, but want of capital has made it impossible to go down more than a few hundred feet at most. Does that prove that they do not go down? Or rather does it not prove, from the experience of deep mining in the middle counties, that when a ledge pays well for a few hundred feet down that still deeper it will almost surely open out bigger and richer?

Enough prospecting has been done to prove beyond a shadow of doubt that Shasta county is rich in the precious minerals, but the average miner is not able to put up the necessary machinery to work his mine properly, and is obliged to work it in some crude manner in keeping with his means, and thus a mine that should produce its millions only yields a few thousand a year; and right there, I day say, is one reason why capitalist are led to believe that there is nothing in this county worth their notice.

There has been some San Francisco capital invested here which proved a failure, simply because the purchaser did not either personally or through some capable and trusty person investigate the property thoroughly and learn if it had any real merit or was simply an imaginary mine through and by which the sharp seller hoped to make a raise. Such transactions have been our curse. But mines, or more properly speaking, locations, that are worthless are the very ones to seek capital. The owners know they are worthless, and they give a third or half interest to some sharp man, and he goes below with a splendid showing on paper, and too often succeeds in selling the location. Such sales prove not only a loss to the purchaser, but they strengthen the prejudices against all mines in that vicinity, and thus those who have mines of real merit are made to suffer from the greed of a few unprincipled scoundrels.

Another obstacle common to all camps are the drones and would-be mining-sharps, and of the two the last are the greatest nuisance; they are always on the alert to see what everyone is doing, free with their advice and opinion, envious and jealous of any one who, by hard work and close attention to his own business, is likely to succeed, ever ready to cry down and condemn any enterprise but their own, and lacking in common sense to see that any success or strike in camp helps, to a certain extent, to build up the whole camp.

But notwithstanding these drawbacks, there are many mines of real merit in Shasta county which are slowly but surely pushing their way to the front.

We lay claim to as rich seam, pocket and quartz diggings as any county in the State, and I predict the time is not far distant when our claim will be admitted by the most skeptical.

In another letter I will give some of the reasons why so many mines prove nonproductive; also why so many companies, after spending thousands of dollars in developing a mine and putting up machinery, are obliged to close down and enter up a large sum in the loss account of the ledger. HOLBROOK.

FOOD ADULTERATION.—Just at this time there is a commotion in Paris over the discovery that nearly every article of food which will admit of doctoring is adulterated. A series of analyses were made at the municipal laboratory, the results of which first drew attention to the matter. Of 62 samples of butter only 11 were found to be pure, 25 being described as "passable," and 26 as absolutely bad; of 31 samples of flour only 18 were unadulterated; and pure ground coffee was the exception, not the rule. Pepper showed the vilest adulteration, "the sweepings of the large shops" being a frequent ingredient, and only one sample in three being what it pretended to be. This is bad enough on the Parisians, but it is well known that the system of adulterating food prevails in this country also. The article of powdered sugar is in many instances mixed with flour. To obtain the proof of this—which is familiar to housekeepers—it is only necessary to drop a spoonful of the so-called sugar into a glass of water, which it will soon whiten to the color of milk. But flour is a harmless ingredient. If nothing worse were put into our food we would at least escape the chances of being injured in health. A great deal has been said and written against the obnoxious practice with but little effect. It will never be suppressed until after the passage of such laws as can and will be rigorously enforced.

FORMATION OF ORE VEINS.—It appears from a recent observation by Dr. Fleitmann, of Iserlohn, Germany, known as the inventor of a process for welding nickle, that the formation of ore veins need not necessarily occupy such long periods of time as we are generally inclined to accord to it. Dr. Fleitmann gave his experience as follows: Some two years ago he had the bottom of a stable pit filled and rammed with common clay containing iron. The pit had served its purpose for storing dung for about two years, during which time, occasionally, to prevent overheating, water had been poured over it. Lately it became necessary to remove the pit, when to the great surprise of Dr. Fleitmann, he found the clay had entirely changed in character, and had become white; it was, moreover, divided in numerous directions by fissures, from 1 25th to 1-6th inch in width, which were filled by compact iron pyrites. The explanation Dr. Fleitmann gives is that the iron oxide of the clay was changed by the water, containing sulphate of ammonia, into sulphate of iron, and the latter had, in accordance with molecular attraction, deposited itself in groups of fissures.

A Model for Young Men.

Pluck and Perseverance in the Mines.

Although hydraulic mining as a State industry has of late years been thrown somewhat in the background, still, as an industry that has contributed largely to the prosperity of the State, it is worthy of consideration, and the men who have achieved success in that calling are worthy examples of executive ability. In this, more perhaps than some other calling, the traits of business tact, good judgement and a perseverance that never lags are essential to success, for the miner has not the assurance of the farmer, that as he sows so shall he reap. It is the possible chance of achieving success that enables the miner to persevere under discouraging circumstances, that may result in realizing the ambition of his life, for he has not sown where he expects to reap, and the blind and fickle goddess may have held out hopes as delusive as "Dead Sea fruits that tempt the eye, but turn to ashes on the lips." A notable instance of pluck and perseverance that never dreamed of the possibility of failure may be found in the business tact and experience of Chas. Waldeyer, Esq., of Cherokee, starting into the Table Mountain mining claim as early as 1856, and having faith in the richness of the deposit he sought to reach, the work of developing the mine was steadily continued for a quarter of a century, many times under circumstances that would have discouraged anyone except a man of intelligence, endowed with pluck and unyielding perseverance, determined to overcome all obstacles. His firm, steadfast and indomitable energy and fruitful resources carried on the work of this company for more than a quarter of a century, until the fortunate holders of the stock realized handsomely. His firmness, energy, business tact, and never flagging perseverance, in connection with the able and searching reports made from time to time on the Cherokee mines, attracted general attention, and when a consolidation of mining interests in that vicinity occurred, Mr. Waldeyer was chosen its superintendent and given general charge of its interests. His long observation, familiarity and experience with the mines of that section enabled him at once to inaugurate and carry out extensive improvements that enabled the mines of Cherokee to be worked to a depth and extent not generally deemed practicable by those familiar with the mine since the first discovery of surface gold in that locality.

At the early date in which Mr. Waldeyer began the development of the Cherokee mines, or the dead work of putting a mine in order, and driving shafts and levels in search of "pay dirt," mining for gold or silver in California had been confined to two principal classes, viz: one of which was adopted where the ore occurrs in veins or lodes, and the other placer mining, which was conducted not only in the beds of existing, but of ancient streams, and was rather more a collecting operation, and afforded a more abundant and rapid harvest for a short period than could be realized from veins. The veins and gulches were absolutely natural sluices, in which the gold, broken from veins and lodes, was gradually concentrated, but the distribution of gold in such sluices was very irregular. To tap the mountain of deposit from which these natural ravines and gulches had been supplied, was the work to which Mr. Waldeyer devoted himself, and the dead work, or work of development, occupied over a quarter of a century. This gave rise to mining in alluvial deposite, a third method largely practiced in California, and includes the comparatively new process of hydraulic mining. Early after the adoption of this process of mining, the Spring Valley mine recognized the rights of those who were injured by their extensive mining operations, and adopted measures to take care of the debris sent down by their hydraulic process. Of course, we do not credit Mr. Waldeyer alone with organizing and perfecting the vast system of mining now in operation at Cherokee. For nearly or quite one-fourth of a century his claim was separate from that of the Spring Valley, with its miles of ditches and pipes for bringing in water, its reservoirs and canals for storing and conducting away its debris. That was the result of the thought and experience of the members of the old Cherokee Co., all of whom have been and are enterprising and worthy citizens of the county. We have simply referred to Mr. Waldeyer as one whose faith and energy, and untiring labor in the dead work necessary for the development and successful opening of a mine, is worthy of imitation by those who are starting in life, with their own fortunes to carve out by sublimity of faith and unyielding pluck and perseverance.—*Butte Record.*

NEVADA is having a tough time of general depression brought about mainly by stock swindles, which have discouraged and drawn capital out of our State. How long this condition of affairs has existed we are unable to say, but when the reaction, which must inevitably come, once begins there will be an era of development of mines that will bring Nevada again to the front as the greatest silver mining district in the world. Railroads will soon make transportation of machinery and supplies as cheap as in other States, and then mines at present lying idle will take their proper place as profitable bullion producers, and places now almost deserted will become thriving towns.—*Grantsville Bonanza.*

MECHANICAL PROGRESS.

The Antiquity of Cast-Iron.

A correspondont of *The Blacksmith*, writing from Pocassett, Mass., sends a clippiag from an old newspaper on the snbject of the first casting of iron. We quote in full as likely to be of interest to our readers without endorsing its historical accuracy:

Cast-iron was not in commercial use before the year of 1700, when Abraham Darby, an intelligent mechanic, who had brought some Dutch workmen to establish a brass foundry at Bristol, Eng., conceived the idea that iron might be substituted for brass. This his workmen did not succeed in effecting, being probably too much prejudiced in favor of the metal with which they were best acquainted. A Welsh shepherd boy named John Thomas had, some little time previous to this, been received by Abraham Darby into his workshop on the recommendation of a distant relative. While looking on during the experiments of the Dutch workmen, he said to Abraham Darby that he thought he saw where they had missed it. He begged to be allowed to try; so he and Abraham Darby remained alone in the workshop all night, struggling with the refractory metal and imperfect molds. The hours passed on and daylight appeared, but neither would leave his task; and just as morning dawned they succeeded in casting an iron pot complete. The boy entered into an agreement with Abraham Darby to serve him and keep the secret. He was enticed by the offer of double wages to leave his master, but he continued faithful; and from 1709 to 1828 the family of Thomas were confidential and much-valued agents to the descendants of Abraham Darby. For more than 100 years after the night in which Thomas and his master succeeded in making an iron casting in a mould of fine sand, contained in frames and with air-holes, the same process was practiced and kept secret at Colebrook Dale with plugged keyholes and barred doors.

HEAVY IRON WORK.—It seems almost probable that, just at the time when the chief difficulties in the way of welding disappear by reason of our better knowledge and skill in manipulation, the necessity for welding in large masses will be avoided by the use of cast metal. Heavy hammers, furnaces with neutral or reducing flames, and increased facilities for handling large masses of metals have been making more and more difficult forgings possible, but the introduction of cast steel of almost any desired quality seems to be likely to render forging an art of the past. In smaller masses, like boiler plates, great progress is being made both in this country and abroad. Bottles, buoys, small boiler shells, fire-boxes, and in fact an immense variety of shapes are now being made out of plate iron without seams or rivets. Very considerable advance is being made in the production of seamless tubes of large size, flat-welded, and of cylinders with the heads welded in. Why we should not have boilers welded together seems to be an unanswered question, the only difficulty being the want of proper plant to manipulate the sheets. Hydraulic welding is making great advances, and some of our large locomotive works are doing very remarkable work in this way. It is notable, however, that in this large work, although an enormous pressure is necessary, the pressure must not be too great, for otherwise the metal which is sufficiently soft to form the weld will be squeezed out and the cooler metal only remain.

RUBBER PASTE FOR DRIVING BELTS.—A foreign paper gives this recipe: Half a kilogram of finely cut caoutchouc is melted with half a kilogram of oil of turpentine in a well covered iron pot at a temperature of 50° C. When all is melted 400 grams colophony and afterwards 400 grams yellow wax are added to the mixture, which must be stirred now and then. In another pot 1.5 kilogram of whale oil and .5 kilogram of tallow are melted, and then the contents of the two pots are mixed while hot with continual stirring, which is continued till the mixture solidifies. The use of the paste is as follows: Old brittle belts are brushed over with it in the sun or in a warm room and allowed to dry. While being used the inner side of the new as well as old straps is from time to time smeared with the paste, which renders them durable and causes them to adhere well to the pulleys. Instead of pure caoutchouc India-rubber waste, which has previously been boiled with caustic soda solution for a quarter to half an hour, may be used; but instead of 500 grams, about 625 grams should be taken.

LIGHT nickel plating, it is said, may be done by heating a bath of pure granulated tin, argol (crude tartar) and water to boiling, and adding a small quantity of red-hot nickel oxide. A brass or copper article immersed in this solution is instantly covered with nearly pure nickel. By adding a little cobalt carbonate or cobalt tartrate, a bluish tint is produced, varying in intensity with the quantity of cobalt used. While this process may not be of advantage in the instance of large quantities of plating, if found to work satisfactorily it could be advantageously employed in a small way, as for the occasional plating of small articles.

About Patents.

An industrial exchange, discussing the proportion of patents that pay, says: "Once upon a time a Commissioner of Patents, soon after he took the chair and when not very greatly conversant with patent matters, remarked that he supposed it was generally conceded that not one in a hundred patents paid. Now, if that, or anything like it, was a true statement of fact, there would be no demand for patents, and what in the name of all that is business, would men want to take out patents for? Certainly it would not be for the joy inventors find in the target practice the Examiners of the Patent Office have with almost every application. A man who has taken out a patent considers and considers before he makes up his mind to run the flagellating gauntlet of the wise or unwise examiners who seem to strive so hard to ruin a case, and are apparently so wholly indifferent whether or not an inventor has a good patent. * * * The sole and only reason why the number of patents increase so rapidly is because in a business way patents pay—there is money in them."

It is undoubtedly true, that whatever may be the proportion of patents that do not pay, every inventor who applies for a patent does so in the belief that his invention is worth more to him than the cost of securing a patent upon it, and further than this, believes it will pay. Under such circumstances we do not think it is any part of the duty of the examiners to decide whether an invention is valuable or otherwise, or to see how nearly valueless they can render an invention by an emasculation of its most important claims from the patent allowed.—*Western Manufacturer.*

A ROLLING MILL CHALLENGE.—Some years ago one of the Pennsylvania rolling mills made a three-quarter inch rod 223 feet long. The manager of the Albany Iron Works, according to a report of the Troy *Times*, wished to find how long a rod could be rolled there, and after careful preparations the experiment was successfully performed under direction of Superintendent Williams, with Caleb Giles as roller. The rolls had of course to be moved with great rapidity, so as to carry the rod successfully through the several openings before it cooled too far. The result was a three-quarter inch rod, 263 feet long, without any flaw, and of full size from end to end. It is then 40 feet longer than the Pennsylvania rod, and is on exhibition at the mills as a remarkable piece of workmanship. The superintendent wants other iron works to beat this; if they do, he says he will try again. Such a kind of rivalry is highly to be commended.

IRON SHOT.—Many experiments have been made to produce a good merchantable article of iron shot, and from the following announcement it would appear that efforts in that direction were about to be crowned with success. An exchange says: A company has been formed in Iowa for the manufacture of sporting shot from iron. It is stated that the trials which have been made of the shot have proved it to be fully equal and in some respects superior to lead shot. Ovens are now being put up to anneal the shot. The invention is protected by letters patent both in the United States and in Canada. No tower is required, as the shot is made by the process with less than three feet drop. The company are nearly ready to put the new manufacture into the market, and as it can be sold at a much lower price than lead shot, the demand will probably soon assume large proportions. It is said that the iron shot looks well, and can hardly be distinguished from lead shot by inspection.

A STEAM WHEEL.—A novel appliance has recently been patented by Prof. Wellner, of Brunn, Austria. It is called a steam wheel, and is described as consisting of a simple water wheel, immersed for the greater part in hot water contained in a closed vessel. Steam is admitted at the lower part and forces the chambers of the wheel upwards, producing rotation. The steam is introduced in such a manner as to fill only those cells on the rising side, and after a portion of the revolution of the wheel it begins to escape into the steam space above the water. The steam may either be produced directly at the lower part of the apparatus or conducted to the vessel from suitable generators, and the upper tube for discharging the steam may lead either into the open air or into a suitable condenser. The mechanical work consists in the ascent of the specifically lighter steam in the heavier liquid, and the apparatus, when connected with a steam engine, may utilize exhaust steam.

AN IRON MAN.—Launceston, Tasmania, can boast of being the first town which has produced an iron man who can walk like his brethren in flesh without the aid of steam. The curious piece of mechanism we refer to is the invention of Mr. Hornburg, a mechanical engineer. The figure, which is dressed as a footman, is 2 feet 10 inches in hight, and weighs 160 pounds. Its action arises from the power of a spring concealed in its inside, which enables it to walk with the greatest ease and wheel a man's perambulator before it. With the assistance of an ingenious piece of mechanism, an eccentric motion is obtained, which by the help of levers causes the legs to ascend and descend, similar to the walking movements of a human being. The automaton has been exhibited at the local Mechanics' Institute.—*Cotton, Wool and Iron.*

SCIENTIFIC PROGRESS.

An Artificially Smooth Sea—Interesting Experiment.

Something over a year since, Mr. Vinceazo Fondacaro made a voyage from Montevideo to Naples in a 3-ton boat, for the purpose of experimenting on the feasibility of using oil at sea to reduce the roughness of ocean waves. He had a crew of only two men. The voyage was an exceedingly rough one, gales prevailing for nearly three-fourths of the time. Malaga was reached February 4, 1881, and there the voyage ceased for a while, because the funds and stores of the party had become exhausted. The little boat was enabled to ride out the roughest gales in safety by olive oil being scattered on the water.

In an interview immediately after his arrival Mr. Fondacaro said: "I claim to have made no great discovery. I have no valuable patent. For perhaps 200 years it has been known how oil would smooth the ruffled surface of the sea and prevent the waves from breaking, and ships in the whaling trade have often saved themselves from foundering by this means. But until I made my voyage it was not known how small a quantity of oil would accomplish this result. Generally a gallon of oil would enable my boat to lay 'hove to' in a gale of wind for 24 hours and be safe. I did not make this voyage in a spirit of recklessness, but simply to practically test the experiment." Mr. Fondacaro then described how he made use of the oil. It was inclosed in small bottle-shaped bags, each bag containing about half a gallon. In case of a gale of wind, when it became necessary to lay to, a large bag attached to the bow of the boat was thrown overboard. This the sailors call a floating anchor or a drag. This kept his boat's head to the wind. Two of the small bags of oil were then thrown overboard, one fore and one aft. Each bag had a small orifice, through which the oil escaped slowly. It circled around the boat, and prevented the sea from breaking over her and overwhelming her. "Of course," said Mr. Fondacaro, "the oil does not diminish the size of the waves, but renders them comparatively harmless by preventing them from breaking."

THE GREAT RUSSIAN AND THE LICK TELESCOPE.—The work on the lens of the great Russian telescope is practically done. Recently one of the lenses was taken from the polisher, placed in the cell with its mate and put in place in the temporary tube which has been used for testing it upon celestial objects. The lenses and cell casting of the objective weigh about 420 lbs., and four men were needed to handle it. The tube was inverted and the cell put in place and fastened by capstan-headed screws. It was then directed upon several objects, and to the unpracticed eye it seemed perfection. The brilliancy of even the smaller stars to a novice is astonishingly great. A day or two after several other optical tests were applied, and Mr. Alvan Clark said that the glass was so nearly perfect that it would not be advisable to attempt more work upon it, as the risk would be too great in proportion to any possible gain. The aperture of the objective, as our readers may remember, is 30 inches, the greatest that has yet been attempted, or rather the greatest that has yet been completed, for the same firm have a 36 inch objective now in hand for the Lick observatory. One of the Lick lenses is now at the works of Mr. Clark. It is ground and polished, and the firm is awaiting for Chance, of England, to cast a glass suitable for the other lens. It would seem that the optician is much ahead of the glass-worker in skill, and that great advances are still possible in the manufacture of large lenses when the glass-makers can produce finer glass of large dimensions.

HAS THE EARTH A FLUID NUCLEUS?—F. Folie proposes an astronomical criterion for settling the question whether any portion of the interior of the globe is fluid. He finds that Laplace and Poisson have entirely neglected, in their integrations, certain terms which have a period of a day or a fraction of a day. These terms would lead to a diurnal nutation, which could be approximately calculated if there is any considerable portion of melted matter about the center of the earth. Supposing that hypothesis to be true, the determination of the right ascension of stars which are situated as near as possible to the poles should give different values at different hours of the day, especially at epochs when the longitude of the sun and moon is 90°. Folie invites the attention of astronomers to the subject, especially of those who have a good altazimuth, which will enable them to follow the movement of a star, and to make precise determination of its position at every quarter of an hour in its diurnal revolution.—*Bull. de l'Acad. de Belg.*

CAUSE OF SCINTILLATION.—Jamin attributes scintillation to the continually changing curvature of the surface of luminous waves. He has lately made an extended series of observations with Arago's scintillometer, which confirms the theory of Cooke, Newton and Young, while they discredit that of Arago, who attributed the phenomenon to the interference of waves.—*Les Mondes.*

Solar Heat.

Interesting Experiment at Mount Whitney.

Professor S. P. Langley has submitted to the chief signal officer an abstract of the results of the Mount Whitney expedition to determine the amount of heat the sun sends to the earth, in technical terms, the solar constant. Mount Whitney, in southern California, was selected for the observation, because it combined the advantages of great elevation, extreme dryness of atmosphere, and abrupt rise from the plain. The party of observation consisted of Captain O. E. Michaelis, United States Army; two noncommissioned officers of the signal service, six soldiers acting as an escort, four civilian assistants and Prof. Langley. Systematic work did not commence until the last days of August, 1881. Professor Langley summarizes the results ascertained as follows:

"The approximate estimate of the solar constant is from 2.6 to 3.0 caloric, by which is meant that the direct solar radiation, before absorption by the earth's atmosphere, would, in falling for one minute normally, upon an area of one square centimeter, raise the temperature of one gramme of water 2.6 or 3.0 centigrade. This implies its ability to melt annually a crust of ice covering the whole earth over 150 ft. thick. This amount is one-half greater than the received value of Pouillet, and greater than the latest determinations of Messrs. Crova and Violle.

On the summit of Mt. Whitney an ordinary black bulb thermometer, *in vacuo*, rose to 130° Fahrenheit, while the temperature in a blackened copper vessel, covered by two sheets of common window glass, rose above the boiling point. With such a vessel water could be boiled among the snow fields of Mt. Whitney by the direct solar rays.

While the influence of the atmosphere is to shut off from the earth's surface a considerable portion of the sun's heat, by absorbing it, the capacity of the air to store heat and prevent its radiation into space serves to make the earth habitable. Otherwise, in Prof. Langley's opinion, the surface temperature, even under the tropics, would be lower than the lowest recorded degrees of Arctic cold. Another effect of the selective absorption of the atmosphere is to change the apparent color of the sun. In a transparent atmosphere the now "golden sun" would appear blue.

ROTARY ELECTRIC COEFFICIENTS OF METALS.—Dr. E. H. Hall, of Baltimore, communicated a paper to the British Association upon his electric discovery, giving calculations of the degree of rotation produced by a unit of section of various substances; some of the rotations being positive, others negative. Sir William Thompson regarded the communication as the most important that has been made to electrical science since the days of Faraday. It would be interesting, in view of the nature of electricity and of the properties of matter, to know whether there is a direct action of the magnetism upon the current, or whether the action is upon the distribution of the material molecules, changing the molecular constitution and thus changing the conditions of the propagation of the current.—*L'Electricien.*

NEW USE FOR COTTON SEED OIL.—Cotton seed, from being considered a useless waste, to be got rid of by burning or otherwise, is fast becoming a valuable product, and will soon be made to add largely to the profit of the cotton crop. New uses for the seed are constantly being opened up. It is now reported that a factory has been opened at New Orleans to make illuminating and lubricating oil out of cotton seed. The apparent decadence of kerosene and whale oil for moveable lamp use may possibly soon open up a valuable market for cotton seed oil for that purpose. It seems to be a rule that every approaching need is sure to be met and supplied either by natural discoveries or by the inventive genius of man.

CARRYING CAPACITY OF ELECTRIC WIRES.—Prof. Forbes has been experimenting with wire to determine the thickness required for carrying different electric currents without overheating, and announces as a result that if you carry a definite amount of current through a wire of a certain diameter without heating it over a temperature of over 150°, then, in order to carry a current twice as great without overheating, the wire used must be twice the diameter or four times the section. This is an important matter, if true, for the size of conductors is a very important element in the cost of a plant for electric lighting, and conductors liable to be overheated greatly increase the cost of the current, besides being dangerous.

ELECTRICAL STORAGE has become a fixed and practical fact, and is, without doubt, one of the most important inventions and discoveries of this age of wonders. It renders available the applications of electricity for uses otherwise impossible. Attention will now be given to reducing the size and weight of accumulators.

A "BENT EQUATORIAL" TELESCOPE, an invention of Mons. Loewy, is in operation at the Paris observatory. The peculiarity of the instrument is that, in consequence of the bending and the use of two reflecting mirrors, the astronomer can observe all the celestial bodies without rising from his table.

Mining Share Market.

Mining stocks are exceedingly quiet, and fluctuations are slight. The main item of interest just now is the action of the investigatory committee of the Stock Board in the matter of the management of mining companies. As for the mines, the operations now in progress and about to be commenced are what mining men have been waiting for during the past two or three years. In all the vast extent of ground now opened up to exploration in the north end mines, not one crosscut is as yet within 50 ft. of the point where it was expected a change of formation would be found; indeed, they have not yet fairly commenced the work of running crosscuts. At the joint Ophir and Mexican winze, now within 12 or 14 ft. of the 3100 level, they are now finding in the bottom seams of ore from one inch to two inches in width. These seams contain sufficient metal to cause the whole of the material to yield assays. As soon as this winze reaches the 3100 level and a sump is dug crosscutting will be commenced. Instead of running a drift along the course of the vein they will at once run across it. At another point there is also encouraging news. The joint south drift on the 2700 level of the Con. Virginia is passing into a new formation, which contains streaks of quartz that yield low assays. This is at a point, too, where nothing was found immediately above. What will be developed at this point remains to be seen. They may already have found as good ground as there is in that vicinity, or there may be somewhere ahead a large deposit of paying ore.

The Gould & Curry folks are just now fairly started off in the work of exploring their ground, an event for which all have been waiting for some years.

In the middle mines, the work of exploring the vein for a distance of several hundred feet along its course is now being actively prosecuted. The Chollar folks are now passing into a very interesting section, and are liable almost any day to find ore.

COPPER.—The unsatisfactory position of political and financial affairs in France not only prevents shipments there from England of copper, but has led to considerable sales in the English market for copper held on French account. The present depression in the value of copper in England is attributed to this and to the absence of demand for export to India. Quotations of copper on the 1st inst., according to James Lewis & Sons' monthly report of ores and metals, were as follows: Ores, 13s. 6d. to 13s. 9d., and regulus, 13s. 9d. to 14s. per unit. Chile bars of good ordinary brands were worth £66 5s. to £66 10s. for spot, and £67 5s. to £66 10s. for arrival parcels. Stocks of Chile produce equal 23,520 tons fine, and the total visible supply is 49,769 tons fine. Imports of copper to England from January 1st to 30th of November equal 74,456 tons fine.

DE LESSEPS announces that the creation of an inland sea in Africa will be prosecuted by private enterprise.

News in Brief.

THE United States ship *Alaska* is being fitted for a voyage to the Hawaiian Islands to participate in the coronation of King Kalakaua.

IN the Maine ship-building districts during the year there were launched a total tonnage of 62 567, and there is now on the stocks a tonnage of 23,016.

A NEW ORLEANS drummer was detained three days in New Laredo, on the Rio Grande, getting a sample trunk passed through the routine of the Mexican Custom House.

THERE is a great stir among the German press in consequence of the arrest at Vienna of the Berlin journalists who fled to Austria to avoid the fulfillment of sentences to eight months' imprisonment for libeling Bismarck.

THE Cheyennes are peaceably organizing to protect themselves from the impositions of large cattle raisers. The Indians propose taxation pro rata among the herders, which it is thought will be a protection to the lesser cattle dealers.

A TELEGRAM from Troutsnan, Bohemia, states that 50 spiritualists residing there have been summoned before a magistrate. The local press urges the Minister of the Interior to institute an inquiry on the subject of spiritualism, owing to the number of cases of mental derangement arising from its practices.

A COMMITTEE at Paris for the promotion of a treaty of commerce between France and the United States have decided to make presentations to the French Government next week, urging it to carefully watch the interests of French commerce during the discussions in Washington on the tariff question.

A LARGELY attended meeting was held in London Sunday night for the purpose of organizing a fund to relieve the distress in Ireland. Many telegrams and letters from clergymen, describing the outlook as a gloomy and appalling one, and stating that the people were on the verge of famine, were read.

AN effective medicine for kidney diseases, low fevers and nervous prostration, and well worthy of a trial, is Brown's Iron Bitters.

STYLOGRAPHIC PEN.—A new pattern of stylographic pen is being introduced by the Stylographic Pen Company, 290 Washington St., Boston, Mass. This latest invented pen combines new principles in its construction which make it about complete. In addition to a diamond point, which can never wear out, it is also stronger. The spring is protected from clogging with the ink, and the needle can be extended as it becomes shortened. It combines all the readiness of a lead pencil and the durability of any pen. There is no stopping to dip for ink when a word is half written. The entire material of the pen is non-corrosive. When it is not in use it may be closed up and laid away, or carried in the pocket for weeks, it being perfectly air tight, and then in a moment put to work. The writer has used the old form of pen for some time, but this is said to be superior. Pens will be sent by return mail when applied for; they are from $2 to $3.50. The same company also make Livermore's new automatic pencil, a self-setting pencil, with plain, indelible or copying lead.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

JACKSON.—Amador *Ledger*, Dec. 16: This promising mining claim came to a standstill Friday evening of last week—the day after striking the rich ore reported in our last issue. E. Ginocchio returned from San Francisco that evening, and reported that his efforts to bring the bondholders to a clear understanding in regard to the settlement of the outstanding indebtedness had been unsuccessful, and informed the employees that the property would not be holden for any further work done upon it. In this state of affairs the workmen, 12 or 14 in number, quit at once. Nothing whatever has been done since—not even the taking out of water. How long the property will remain idle is uncertain, but probably not long. It is said there are other parties ready to take hold if the difficulties with the present bondsmen can be overcome. By the terms of the bond the next payment falls due in March, and the bondsmen will hold the fort until then, unless they voluntarily surrender their claim, which at present they are not disposed to.

MISCELLANEOUS.—Mr. Goodwin, one of the principal owners in the Quartz Mountain mine, has two men engaged in taking out quartz, and it is probable that the mine will push along in the spring. The Trustees of the school district, who have been holding school in the boarding-house so far, have been notified that the building will probably be needed by the owners ere long..... A patent has just been issued to Lawrence Evans for the Pioneer quartz mine in Plymouth mining district.

FROM SUTTER CREEK.—A severe blow was given to the town last Monday, by the old Amador mine suspending all underground work. Orders were sent up to close down, with the exception of keeping the water out, which will necessitate the retention of the engineers. But few men have been employed by the company for many months. Whether the suspension of work will be permanent I am unable to say, but rumors are afloat that the old works will be reopened in the spring. Considerable rock has been taken out, and the mill will likely be kept running until it is all crushed..... The Mahoney is looking more encouraging than at any time for months past. A large body of ore has been struck in the lower levels, and it is said to be of good quality. Ex Senator Stewart inspected the mine on Monday, and is well satisfied with the prospects. He left for the city the following morning.

CALAVERAS.

THE HADLOCK MINE.—Calaveras *Chronicle*, Dec. 23: J. B. Hadlock, Esq., of this place, owner of the Hadlock mine, near Gleucoe, is having work done upon the mine in the way of development. The old shaft is about 70 ft deep, at which depth a level has been run. This shaft being in a bad condition, a new shaft is being sunk.

THE TIGER MINE.—Some very rich rock has been struck in the Tiger mine, near Rich Gulch. Considerable money has been spent upon this mine by former owners, one party having expended $18,000 upon it, putting up a mill, buildings, and other requirements for working the mine; but, owing to mismanagement, according to our information, results proved unsatisfactory and work was suspended. The mine is now owned by C. Schlund, Esq., assayer and buyer of gold dust in this place, and a short time since men were put to work to re-open the mine. The prospect tunnel had been run alongside of the lead a distance of 400 ft, at the end of which a crosscut was run showing a vein of 17 ft in width. This tunnel was considerably caved, and is now being re-timbered and put in working condition. We were shown a specimen of the rock from this mine, weighing about 2 pounds, which contained a large amount of fine gold, which could be easily seen with the naked eye. Mr. Schlund informed us that this piece of quartz contained gold to the amount of $4.80, or at the rate of $4 800 per ton. There is a 10-stamp mill in excellent condition upon the mine, besides other necessary buildings, tools, etc., and it will be an easy matter to prospect it thoroughly.

EL DORADO.

GREENWOOD.—Georgetown *Gazette*, Dec. 23: The miners are now anticipating a rainfall that will enable them to get to work in earnest, the season so far having been adverse to all mining operations dependent on free water. Arrangements are also being made by which several of our leading mines will resume operations early in the new year, when we hope to see an end to the prevailing dull times. River mining is closed for the season, with the prospect of being resumed next season with renewed vigor. The elevator system of working is now proved to be a success, and its adaptation to many river claims now lying idle will be certain.

A NEW QUARTZ MILL.—Mr. Zentgraf has just completed a 5-stamp mill on his quartz mining property at Wildgoose Flat, and commenced running it last week. Mr. Zentgraf has a very valuable quartz lode, which he has prospected in a thorough manner with most promising results, and has built the mill for the purpose of more efficiently testing the ore, intending to enlarge its capacity as he progresses in his work. The appearance of the ore now on the dump justifies the opinion that this will become requisite at a very early day. Mr. Zentgraf is to be complimented on the careful manner in which he has prospected this mining property, which has every advantage of locality and surroundings to economize working, and gives every indication of proving one of the finest quartz mining properties in this county.

INYO.

MONOCK—Inyo *Independent*, Dec. 23: Supt. Fitzgerald in a private letter conveys information as to Modock workings as follows: "I closed furnace down after losing two water-jackets. I came to the conclusion that I would not have anything more to do with old jackets, and so I have sent for two of the latest improved style. I run through about 75 tons of ore, and shipped 16 tons of bullion, the ore turning out splendidly. Am now getting in more coal, wood and iron, and while waiting for the jackets will take out at least 100 tons of ore from my own mines. Will have the jackets here about Christmas, and will start up on or before the 1st of January."

CLEAN-UP.—The proceeds of working 16 tons of ore from the Lapwing mine, in the McEvoy mill at Beveridge, was brought in Monday. It amounted to 61 ozs. of gold, worth $915. We understand that work will be resumed on the mine.

BIG SHELL BURSTED.—A note from Darwin, under date December 20th, received at this office on Thursday night, contained the following terse but momentous information: "The big mill at Panamint was discovered to be on fire at 6 o'clock last night, and was burned to the ground." We have but few particulars. Another letter states that the fire originated from a retort bursting. This authority states that the works were insured for $40,000. Supt. Pheby had about commenced a run of 700 tons of ore, which he calculated would gain for him the credit of the greatest amount of bullion yielded during any one run of the works. It was his plan to keep some 15 men at work in the mines during the winter, getting out ore for the coming spring. How far this disaster will affect that arrangement is not known. The big mill was by far the most important and pretentious structure in this county, if not in these two mining counties. It was erected in 1874-5, by the Surprise Valley Water, Mining and Milling Co., which was led by Senators John P. Jones and Wm. M. Stewart. The Stedtfelt furnace alone cost $75,000, and the entire plant the sum of $385,000, which came out of nearly $2,000,000 expended by the company in buying mines, great buildings, roads and general improvements.

NEVADA.

THE IDAHO.—*Tidings*, Dec. 21: The pipe to bring water to the Idaho mine has been shipped for this place. Most

of the pipe will be made at the shops of the Idaho Company, only about 1 300 ft of pipe (second-hand) having been bought. The 18 level of the mine is looking splendid, as Mr. Edward Coleman informs us, while the 12 level is not looking as well as it might. Drifting is going on in the 14 level, but as yet none of the ledge has been taken down. The ledge is a little more than the average size for that mine, and it is the opinion of the managers that when the ledge is taken out and crushed it will prove fully as valuable as that from any level which has ever been opened in the mine.

HARTLEY.—About 80 tons of ore is now lying on the dump of the Hartley mine, and it will probably be put through the mill next week. A crushing of 7 tons was made several days since, and, from the appearance of the plates, the yield will be favorable. The crushing was stopped on account of the breakage of the rock-breaker, but crushing will be resumed as speedily as possible. The shaft is now down about 600 ft, and drifting commenced north and south.

EAST EUREKA.—The East Eureka ceased work for the season Thursday, and in all probability will remain idle till spring, or until the roads get into condition to haul wood, as the scarcity of wood is what necessitated the closing down of the mine. The mine is left in good shape, and will be opened up as fast as steam can be made or water attached. The ledge of paying ore now known to exist in the lower level will be rapidly developed and put through the mill, when material necessary for work can be obtained.

IMPERIAL.—The Imperial company have their mill nearly ready—in fact are only waiting now for the water pipe. The Imperial in her depths is looking as well as could be desired, and if the ledge "pans out" anywhere near what its prospects have indicated, there is untold wealth yet to be taken from its treasure chambers. As fine a prospect in gold and sulphurets as we have ever seen was not long since exhibited by some Imperial miners, and was said to have been the "savings" from a drill-hole in the ledge.

THE BALTIC MILL.—Grass Valley *Union*, Dec. 26: Wm. S. May, who came down from the Baltic mine, in Eureka to-ship, on Monday, informs the *Union* that the new 10-stamp mill is now running on ore from the mine and working perfectly. The wood sheds and all the buildings are covered in, and everything made snug against the winter snowstorms, which are certain to come in that elevated region. A large amount of quartz is now out ready for crushing, which is taken from the upper tunnel, which prospects finely in free gold. The ledge is 3½ ft in size. Another tunnel has been started, which is 300 ft lower than the one from which quartz is being extracted, and from which the ores will run directly into the mill. When the ledge is struck in this tunnel there will be a large amount of backs above it which will supply rock to the mill for a long time to come. The Baltic mine is opening out auspiciously, and good clean-ups are sure to follow.

THE EMPIRE.—This mine is working a large number of men, and the mill is kept running day and night. It was rumored on the streets that the Empire had been sold for a large sum of money to some Eastern parties, but, as far as we could learn, there is no foundation for the rumor.

PLACER.

MINING AT DUTCH FLAT.—Placer *Herald*, Dec. 23: On the North Star claim, just below the town of Dutch Flat, an incline is being run to the bedrock, with the view of ascertaining whether the gravel on the bottom will pay for drifting. This mine is owned by John and William Rablin, James Davis, David Morshead and J. W. Thomas. They have a haud whim for hoisting purposes, and a suitable building for shelter built over the mouth of the incline, and are driving the work ahead as fast as strong arms and plenty of powder can perform the work. They expect to have to sink about 140 ft. If they should find the gravel at the bottom rich enough to pay for drifting, and some of the company are confident they will, the result will be, doubtless, to induce others to prospect their claims in a similar manner, and thus give a new stimulus, to some extent at least, to the now languishing mining interests of Dutch Flat.....F. C. Hoos, whose claim is near the North Star, is fitting up on a small scale for washing, and this is about all that is being done at present in the mining line, in a district which abounds in rich hydraulic gravel, and which before the era of injunctions teemed with wealth and all the life and happiness incident to prosperity.

PLUMAS.

CRESCENT PAYING BIG.—Plumas *National*, Dec. 16: A correspondent informs us that the Crescent mill cleaned up on Sunday, and from a 5 days' run with 4 stamps the yield was $3,500. This shows that the rock is paying wonderfully—probably in the neighborhood of $35 per ton. Davis has found the right lead this time, and will work it for all it is worth.

SOUTH FORK.—Dennis Williams and Billy Woods have recently struck good prospects in their tunnel near the head of the South Fork, and near the road from Onion Valley to Observille. The tunnel is in some 300 ft, and is too high. A shaft to bedrock, 20 ft deep, shows good prospects, with the rock pitching into the hill. They will follow it as far as possible from the shaft, and then run a new tunnel to tap the gravel at the right depth.

EMERALD DISTRICT.—Greenville *Bulletin*, Dec. 21: There is a good deal of activity in Emerald district, and next spring it will be one of the liveliest camps in the county. The Lucky S. mine has been incorporated; the stock is divided into 100,000 shares, and all the shares that this company will sell have been taken by residents of the county. The capital realized from the sale of these shares will be used for the development of the mine during the winter. At present work is being pushed as rapidly as possible. The ledge is showing up well, and the ore is of higher grade than any yet found in the mines of Indian Valley. The country comprised in Emerald district has yielded a large amount of money from placer claims for years past, but no effort has been made to find quartz till the present season. As the whole interest is in the hands of men who live in the county, the success of the company will be of much greater value to the country than if it were in the hands of strangers.

ROUND VALLEY RESERVOIR.—One year ago to-day the store of water in the Round Valley reservoir was exhausted, and every mill in the district run by water power stopped in consequence, and remained stopped during three months. As near as the opinion of those best able to make a correct estimate, there is at least two months' supply in the reservoir, and we are now in the season of rainfall. During the next two months the basin usually receives its greatest accession of water, so that all danger of a repetition of last year's water famine may be regarded as out of the question. A new waste gate has been lately put in, and everything about the dam put in the best possible order for receiving and retaining the new supply.

TAYLOR-PLUMAS MINS.—The mill building is now finished, so far as outside work is concerned. On the inside the frames and other work necessary for machinery are rapidly approaching completion, and if no unforseen cause of delay arises, the mill will be ready for starting up early in January. All other outside work is finished, with the exception of laying the pipe, and as the trenches are dug and everything else in readiness, this will take but very little time. In the mine work is being pushed ahead as rapidly as possible, and new ground is being opened up that will supply a large amount of ore as soon as needed. The ledge continues to maintain the same average width, and looks as well as heretofore.

SAN BERNARDINO.

CALICO ITEMS.—Colton *Semi-Tropic*, Dec. 23: Mr. J. S. Eckles, of Santa Ana, has purchased the mining interests formerly owned by W. R. Barber, in East Calico. Morrie & Wiseman have started up work on the Dragon No. 1 mine with four men. They will continue sinking the shaft on the claim. The Oriental mining company has workmen now employed in opening the Occidental. The ore lies in an immense body and is very rich. Last Sunday about a dozen men were employed in opening out a road up the canyon which leads to the Oriental and Occidental mines. Mr. S. B. McTarnahan, of Los Angeles, sold to Mr. S. B. A. Sparkuhle a three-quarter interest in and to the Anglesite and Big Sunflower mines for the sum of $2,500. These claims are located near the Burning Moscow mine. The Charmer mine is now being thoroughly prospected by its owners—Messrs. Wm. Dickinson & J. H. McCutcheon. A vein of very fine ore has been discovered in a spar ledge near the center of the mine. A tunnel is being run from a point about 35 ft below the mineral croppings to penetrate the ledge transversely. A chute is being constructed on the King mine for the purpose of lowering the ore to the wagon road below. It is 46 ft high and 190 ft long. The car track running out to the incline is 65 ft long. At the bottom of the chute is a bin which will hold 200 tons of ore. It will be completed in a week. Several hundred yards below the chute a tunnel is being run to tap the ledge. A track has been laid in the tunnnel on which the dump car is run.

ALHAMBRA.—This mine, owned by Mrs. Townsend, Allison and others, is situated on a prominent ledge which extends for a long distance, and on which several other good claims are located, such as the Gobler, Golconda, etc. John Kratzmayer has leased the mine, and is working it on shares.

MESSRS. COBARD & HUNTINGTON, of the Bismarck mine, have commenced sinking a shaft on their main ledge which shows a good body of ore, dipping, as is the case with most of the ledges in that vicinity, to the south. These gentlemen have for some time been transferring ore from the mine to the village on the backs of donkeys, but propose now to abandon this rather tedious mode of transportation and keep their ore on the dump until the completion of the Oriental Co.'s road now under progress of construction, which will give them a much more convenient outlet.

SIERRA.

PAY AGAIN.—*Mountain Messenger*, Dec. 23: Uncle Jack Billings has again struck good pay in his diggings at Sebastopol. Jack deserves to be successful, as he is industrious and persevering.

PIKE CITY.—The Alaska mine, at Pike City, is working 85 men, 65 underground and 20 in the mill. The company is at work on a 2-ft ledge, which, it is presumed, is paying well. At any rate, $3,600 worth of specimens were taken from the mine a short time since. The mill used in crushing the ore for the Alaska is the same as used to be at the East Eureka mine in Grass Valley. There is considerable prospecting going on in the vicinity of Pike City, and the prospecting is generally attended with very favorable results. The Alaska mine is owned by an Eastern company, and Capt. F. K. Shawhan, an experienced miner, is the superintendent.

TUOLUMNE.

SUCCESSFUL.—*Union-Democrat*, Dec. 16: The Green mine, near Sugar Pine, owned by Clark, Brown & Co., is in successful operation. The improvements consist of a 10-stamp mill and hoisting works, both of a superior character. They were erected since the 1st of June, at a cost of over $20,000. The gold produced has more than paid for the entire outlay. A shaft is being continued while a level is also run. The vein in the shaft and level is fine gold-bearing rock. Every indication goes to show that it is a property of intrinsic value, that will yield the owners a very handsome return for their labors of development. The last clean-up was made Saturday, which showed the yield to be more than $100 per ton.

TRINITY.

THE GLORIOUS STORM.—Trinity *Journal*, Dec. 1: Having waited so long for a "good storm," this community had reached that condition where small favors are thankfully received, and now are more than willing to take large ones in proportion. In fact the mining outlook was beginning to look just a little discouraging, when, with the opening of the present week, commenced the first favorable storm of the season. Starting with several inches of heavy snow in the Basin, this has since been washed off with cool rains, while snow has probably continued to fall on the higher hills and mountains. Should the present storm keep up as favorably as it commenced and as at present promised, a prosperous mining season is more than probable. The rainfall this week, up to Friday morning, measured 1.17 inches, making a total for the season of 13 02, in addition to which 8½ inches of snow, the first of the season, fell in the Basin this week. The total rainfall was erroneously reported last week at 9.85, when it should have been 11.85 inches.

NEVADA.

WASHOE DISTRICT.

SIERRA NEVADA.—*Enterprise*, Dec. 26: The east crosscut on the 2700 level is out between 60 and 70 ft. Thus far no marked change of material is seen and no change is anticipated until the crosscut is out at least 100 ft. Good progress is making in the new north lateral drift on the 2900 level. On the 2300 level are repairing the winze down to the 2400 level.

MEXICAN.—The joint Union Con. east crosscut is out about 20 ft. It is still in vein formation similar to that in the main drift. The joint Ophir winze is within 12 to 14 ft of the 3100 level. Seams of ore are beginning to show in the bottom.

OPHIR.—Repairs to surface machinery and pumping apparatus, both above and below ground, are completed. The main south drift on the 2900 level is making about 30 ft per week. The bottom of the joint Mexican winze is now within 14 ft of the 3100 level. Some small seams of ore are showing.

ALPHA.—The drift north from the winze is in vein material which shows a good deal of quartz. A crosscut is being run from the south drift which, it is to be hoped, will show up the big bonanza recently found at the Bay.

CROWN POINT.—A considerable amount of ore, averaging about $11.50 per ton, is being extracted from the old upper levels. This ore is being worked at the mills on the Carson river, principally at the Mexican.

HALE AND NORCROSS.—Good headway is making in the joint Savage drift on the 2600 level. The drift will be pushed through to the Savage south line as rapidly as possible.

CON. VIRGINIA.—The joint California southeast drift on the 2700 level is passing into a new formation, consisting of vein material containing streaks of low-grade ore.

NORTH OULD AND CURRY.—The ground passed through in the shaft shows many seams of quartz, though it still blasts well. Some water is soaking in at the bottom.

CALIFORNIA.—The joint consolidated southeast drift on the 2700 level is passing into vein material containing streaks of quartz that are showing metal.

BEST AND BELCHER.—Work has been suspended in the main north drift in order to allow the water to drain out from the face where a drill hole was made.

YELLOW JACKET.—Are now extracting over 50 tons of ore per day. The air is now good, and explorations are being made for new deposits of ore.

SAVAGE.—The joint Hale and Norcross drift on the 2600 level is making good progress. It is being pushed for the Savage south line.

BELCHER.—Are taking out the usual amount of ore from the 1700 level. The ore averages a little over $11 per ton.

UTAH.—Are timbering and repairing the drift on the 1350 level and lagging the incline below the 2500 level.

SCORPION.—The main east crosscut on the 500 level is still in vein material that shows some quartz.

BULLION DISTRICT.

PRODUCING.—*Silver State*, Dec. 21: This district, which is situated south of Beowawe, on the east side of the Lewis range of mountains, is now among the bullion-producing camps of the State. Yesterday Wells, Fargo & Co.'s express took west from this district several small bars of bullion, valued at $2,000. It was shipped by Radovich & Brisbee.

COLUMBUS DISTRICT.

NORTHERN BELLE.—*True Fissure*, Dec. 23: A distance of 17 ft has been made in sinking the winze from the fifth shaft level during the week. It is now down a total depth of 54 ft. The development in the main drift, on the fourth shaft level, still shows ore of an excellent quality, but has narrowed to 6 inches in width. The levels above the adit show no important development, and continue to turn out the usual quantity of ore. The crosscut on the fifth level does not look as promising as was anticipated in the last report. Everything is running smoothly in and about the mine, which is yielding about 64 tons of ore daily. Mill No. 1 is running steadily and doing good work. The bullion shipments amounted to $15,977.15 for the week ending December 21st, and aggregate $42,-233.70 in December account to the same date.

MOUNT DIABLO.—The east drift from winze No. 1 has advanced 12 ft during the week, and shows low-grade ore in the face, with streaks of ore of good grade. A drift is being driven to the west from winze No. 2 to connect with the drift from winze No. 1, having now 20 ft further to go. There are 6 inches of $80 ore in the north crosscut from winze No. 4. A stope has been started from the west drift in the west intermediate drift above winze No. 4, and is now showing 12 inches of $150 ore. The raise from the west drift from the north crosscut, west of the shaft on the third level, shows 15 inches of $00 ore. A small amount of ore, assaying $30 per ton, has been developed in the raise from the west drift from the Callison winze.

EUREKA DISTRICT.

EUREKA TUNNEL.—*Sentinel*, Dec. 19: Things around the Eureka tunnel have an air of prosperity that speaks well for the management and the mine. The lodging houses, boarding house, offices, engine house and outhouses are substantially built, and give the scene the appearance of a quiet little village. Altogether there are 35 men employed about and in the tunnel, giving it the fourth largest force of any mine in the district, the Eureka Con., Richmond and Albion taking precedence. The men are worked on 10-hour shifts, and everything is running as smoothly and systematically as could be desired. The want of machinery is, of course, greatly felt, but we understand that it will soon be supplied. Gen. Connor having visited the Comstock, and being now in San Francisco for that purpose. Whatever ore is now being shipped to the furnaces is raised to the tunnel level by the old windlass method, a slow and tedious way of working a mine nowadays, at least such a large property as the tunnel. No work is being done at the header for the present, though the material passed through, when work was stopped, is of a much more interesting character than the preceding 200 ft. About 400 ft from the breast of the tunnel a splendid spring of mineralized water was discovered a few inches below the tunnel level. The water is strongly impregnated with iron, and bubbles up from a strong formation of shale, which stretches from 150 to 200 ft on either side. The flow is very slight, but a large wooden trough has been set in the ground to catch it, and this is kept full, but the water does not rise over the top. An attempt was made to increase the flow, in order to secure enough water at the mine to run the engine with, but it was like squeezing a lemon. The spring near the mouth continues to furnish enough water for cooking and drinking purposes, and as it is clear, cool and sweet, the miners in the tunnel are more favored than those working in the other mines in the district. The ore bodies worked are 120 ft below the tunnel level, and there is no sign of water

SAFFORD DISTRICT.

ONONDAGA.—Eureka *Sentinel*, Dec. 22: Reports from Safford say that a new and very rich strike has been made in the Onondaga. A correspondent of the *Sentinel* states that the assays run as high as $845 per ton. A number of Eurekans visited the property last Sunday, among whom were Hank Mitchell and Joe Tognini. This new find it is thought may have a tendency to induce the owners of the mine to raise the price and place it at such a figure that the capitalists who are negotiating for it will let it severely alone.

TAYLOR DISTRICT.

LUCKY MINERS.—White Pine *News*, Dec. 18: The statement of the Monitor company, of Taylor district, for five months, from June 1st to December 1st, shows the proceeds to have been $120,000. There are but three owners in the company, all practical miners, who have brought their mine from a mere prospect to its present condition. There are four shafts on the property, neither of which is down deeper than 60 ft from the surface. The hoisting is all done by windlassing, no other power being used.

TUSCARORA DISTRICT.

BELLE ISLE.—*Times-Review*, Dec. 21: North drift, west vein 350 level, has been driven 28 ft since last report.

NORTH BELLE ISLE.—Total depth of shaft 283 ft. Progress since last report 17 ft. Slight increase in the water, otherwise no material change.

INDEPENDENCE.—West crosscut, 300 level, extended 18 ft. No. 1 shaft sunk 9 ft. Total depth, 188 ft. Ledge 4½ ft wide of quartz and vein porphyry.

GRAND PRIZE AND ARGENTA.—Shaft, 778 ft deep. Joint winze is 30 ft deep, and the vein looks favorable in the bottom of the winze. East drift, on 700 level, is in 224 ft. Argenta winze is 58 ft deep.

ELKO CON.—During the past week crosscut in main drift of Shaft No. 1 has been extended a distance of 8 ft. The formation continues hard, but of a very favorable nature. Main drift will be extended during the coming week.

NAVAJO.—Work throughout the mine progressing as usual, with no material changes to note. The stopes are all in good ore. The usual grade of ore has been milled during the past week. Formation continues the same in the crosscut 450 level. Progress, 12 ft since last report.

UNION DISTRICT.

THE MINES.—Grantsville *Bonanza*, Dec. 23: At present in this district little or no work is going on in the mines, and how long a time will elapse before we experience another period of prosperity, no one here knows. All agree, however, that the district contains some of the largest veins and ore deposits in the State of Nevada, but these will have to be worked on an extensive and economical scale to make them dividend payers. There are numbers of good prospects that capital might be induced to develop into remunerative mines if they could only be purchased at reasonable figures, but as a rule they are held for fabulous sums—sums too high altogether for prospect holes—figures so high that they drive capital away. In Grantsville there are some splendid mines, as for instance, the Alexander and Brooklyn) that have produced their thousands of tons of pay rock, and are capable of producing hundreds of thousands of tons more when properly opened—mines that as depth is attained are certain to increase in productiveness and value; and then again there are prospects worth, perhaps, a few hundred dollars that are held for as many thousands. The day is past when men realize a fortune from the sale of a coyote hole. The resumption of work in the Alexander and Brooklyn mines would, of course, give that impetus to mining in this district which so sadly is needed, and all seem to have boated their ores till that period arrives. There is some talk of work being resumed in the Centennial mine. It is a pity to see this property shut down, as it shows every indication of developing into a valuable mine. At Centreville John Centrae is opening up some excellent prospects, which show very fine ore, one of which we should like to see opened to water level. It ought to go down, as the ledge is strong and wide, and if it was ours we would go down on it. At New Buffalo no work is being done, but there are some excellent prospects there that will probably be heard from in the near future. Capital will have to handle this property to make it a paying one. At Union canyon the annual assessment work is being done. Some very rich ore is encountered in the mines, and if rumor speaks truly, there is no reason why the Knickerbocker mill should remain closed down. At Ione quite a number of chlorides are at work taking out rich rock. This camp has been under a cloud for years, and has suffered as much as any camp in Nevada from poor management, but true merit will prevail, and the day will come when the mines of Ione will take high rank with the bullion producers of Nevada.

ARIZONA.

PIONEER POINTS.—*Silver Belt*, Dec. 16: The South Pioneer is looking well. The shaft is now down about 240 ft. Sinking will progress until the 300 level is reached. This mine has an abundance of good ore in sight, in which native silver is visible in some of it to the naked eye. There is a large force at work in the erection of a 10-stamp mill, which is intended to work Howard and South Pioneer ore. Sinking on the Howard is progressing. In passing down about the 200 level a vein of rich ore was struck. It is said there is an abundance of it. The shaft will at once be put down to the 300 level, when crosscutting and stoping will begin in earnest. The Pioneer mill is running on Pioneer ore, and it is a matter of surprise to many the amount of bullion turned out by a 5-stamp mill.

DOS CABEZAS.—Cor. Tombstone *Epitaph*, Dec. 16: The Commonwealth mining company, after having expended some $1,500 in prospecting their mines in Wood canyon, have found on the 120 level a vein of ore, the average assaye of which are $200 per ton, gold and silver. The average width of the ledge is 6 ft. Many had given up, as the Commonwealth company had worked so long, almost one year, without finding anything. But now all have greater faith in the future of the camp, and know that nothing but intelligent and persevering work will bring the camp from a dying condition to the lead of the go-ahead camps of the Territory.

THE Cincinnati & Pittsburg Co.'s mill is running on First Chance ore, and all connected with the company seem to be perfectly satisfied with the result. The manager says the company intend to put up a 40-stamp mill close to the mine and save the expense of hauling ore. The present manager is capable of conducting affairs in a business-like manner and making the mine a paying property. The mill is kept running on ore taken from a shaft that is being sunk on the First Chance. The ledge is about 7½ ft wide, and shows free gold in all ore taken from the shaft. The quality of the ore is much better in the lowest working than it was on or near the surface. The Johnson arastra is running on ore from the Murphy mine, and from what I can learn the ore pays well. The claim owners are only doing enough work to hold their claims, and some men own so many that they are unable to do the work on all of them, and will relocate all claims on which the work has not been done on the first of January. Should the work that is now being done by the Commonwealth and Cincinnati & Pittsburg companies be continued for another year, Dos Cabezas will rank with the most prosperous camp in Arizona. One of the draw backs in Dos Cabezas is scarcity of wood and no teame to haul it from Chiricahuas. All wood brought in sells rapidly for $8 per cord, and it is impossible to get enough for the mills at that price.

IDAHO.

OWYHEE MINES.—*Avalanche*, Dec. 10: Owyhee has been standing on its own merits for the past year, not an incorporated company having worked a mine here except the Golden Cheriot, and that for only a short time. The bullion that has been produced was dug out of the mines by individuals for themselves, and although the amount produced is not large, yet enough has been run into bars and assayed to show that the camp is not dead by any means, but, on the contrary, will pay when handled properly. The crude bullion shipped in that state to California and other places is not included in the bullion production for the period above named. Neither are the ores which have been shipped from this camp to other places to be reduced. Since Jan. 1, 1882, to date, bullion amounting to $205,206.96 has been assayed in this camp. Of the above amount, $159,195.17 was gold and $46,-011.79 was silver. Considering that this was all taken from the quartz mines here by private capital, we think the showing is very good, and only proves that the mines will pay when worked economically by persons who understand the business. Next year we expect to see this amount more than doubled. Owyhee is "not dead, but liveth."

RICH ROCK.—*Idaho World*, Dec. 19: Immensely rich rock was struck in the 400 level of the Gold Hill mine at Quartzburg recently. Bill Fenne, foreman, came out of the works the other day with all his pockets filled with specimens that were yellow with gold. The mine is said to be producing richer ore now than at any time since work was commenced in it—15 or 18 years ago. There is enough rock in sight to keep their 25-stamp mill running day and night for three years. The company made the biggest clean-up a week or two ago ever made from any previous run of the same length of time. We are unable to obtain the figures, as the company is composed of a very peculiar set of men who never make known the results of the clean-ups. All the information we have ever received in regard to this immense mine has come from the men employed therein. The Gold Hill is one of the best paying mines in Idaho, and has paid from the very start. The mill has been running almost constantly day and night for 16 or 18 years. The deeper they go the better it pays, which is the exception and not the rule, we believe, in the history of the working of gold-bearing veins. The shaft, which is on a flat and nearly on a level with Granite creek, has been sunk to the depth of 400 ft. The vein has been worked on the mountain east or northeast of this, the main shaft, and the drifts from the shaft are run into the mountain, so the depth attained on the vein is considerable over 400 ft. The ledge has no regular width. It widens out and "pinches up," in places being several feet in width, and then in others not thicker than a knife blade. The pay does not run regular. Barren spots and pockets alternate each other; but, practically speaking, the mine has paid big from the time work was started to the present time.

NEWS FROM MULDOON.—Wood River *Times*, Dec. 14: A gentleman recently in from Muldoon gives a very satisfactory account of affairs there. The Little Wood River mining and smelting company, which owns the Muldoon and other mines there, have their furnaces in good shape for an early start in the spring, with the bins, both at the mines and smelter, full of ore, and a large quantity in sight. During the few days' trial run about 105 000 lbs of base bullion were smelted out. Next year an effort will be made to lay in supplies of all kinds to continue the campaign until well toward the spring of 1884. An entirely new ore body was struck in the lowest workings of the Muldoon mine a week ago, which, day before yesterday, showed a breast of 5 ft of solid galena, which assays an average of 170 ozs in silver, and much of which goes over 200 ozs. This is much higher-grade ore than any heretofore found in the mine, and tends to indicate that the ore will prove richer in depth. About 30 men are employed in and about the mine, and will be kept all winter. Four or five strong companies, and about twice that number of smaller ones, will operate at Muldoon and vicinity next year, and as they have good property to work they will doubtless make a splendid showing, which will undoubtedly secure the section a big and prolonged boom.

MONTANA.

SUMMIT VALLEY DISTRICT.—Butte *Miner*, Dec. 10: The mining operations during the past week have been characterized by steady work, and the monotony of the reports from the various mines is, perhaps, the best evidence that the mining interests of this camp are on the solid basis of legitimate development.

THE ALICE PROPERTIES.—A large force is being worked in the exploration and development of the 700. Stoping has been prosecuted, as usual, on the 100, 200, 300 and 400 levels with a satisfactory output of ore. A fine body of high-grade ore has been uncovered in the south crosscut from the 100.

M. C. AND V.—Work has been vigorously prosecuted. The most recent strike was in the north vein of the 115 level, which assayed 36§ per cent. of lead and 47.45 ozs in silver.

MAONA CHARTA.—A large force of men are employed in the stopes of the 200 and 300, in which levels a fine vein of high-grade ore has been struck. Winzes have been started to run down on the ore body.

MOULTON.—Work progressing smoothly, and the mine is keeping up its supply of ore. A force of 90 men are employed. The mill has made a steady run during the past 40 days.

The Denver Exposition—No. 18.

[Editorial Correspondence.]

New Mexico—Continued.

Humboldt long ago declared that the wealth of ths world would, at some time in ths future, he found in New Mexico. If the long interval since that declaration was made has passed without any very decided exhibition of wealth from that Territory confirmatory of Humboldt's opinion, there are evidences just beginning to appear which afford ample proof that the prophecy of that great scientist is now about to be realized.

The multiplicity of railroads with which the Territory of New Mexico is beginning to he gridironed, and the covenient connection which has already heen made betwsen that system and the great continental roads, coupled with ths quieting of Indian and horder distnrbances, has, within the past two or three years, given a wonderful impetns to the efforts for the development of ths mineral, agricultural and commercial rssources of that bordsr region of the Amsrican republic.

If ths vast mineral wealth of this Territory has been douhted and overlooked in the past by reason of the more active dsvelopments of other portions of our Rocky mountain and Pacific coast regions, the magnificent display made hy New Mexico at the recent mineral sxposition at Denver has fully dispelled all such douhts, at least from the minds of all who visited that exposition. That display was one of which any State or Territory might well feel proud. If the two or three years since it has been possible to attempt any general development there, have produced the results witnessed at Denver, what may be expected during the next ten years, with the constantly increasing facilities for transportation which will he kept np during that time?

In looking over what has alresdy heen done, and with so many enterprises worthy of specisl mention among the numerous camps scattered throughout the Territory, it becomes exceedingly difficult within the limits of a single letter—the second—which is all we can afford at this time, to enter upon our task without the fear of exciting a feeling of nnjust discrimination. Our remarks must he qnite general in character, with particular allusions to only a very few of the many localities to which onr attention has been juetly called.

General Mineral Characteristics.

The chief mineral helt of New Mexico follows the trend of the Rocky mountains, which enter the Territory from Colorado centrally across the northern horder, and continuing southerly through the Territory to its southern houndary. The precious metals are fonnd throughout the whole extent of this mountain region, and prohahly continue all through the western slope of these mountains into Arizona, although hnt a small portion of this region has as yet heen prospected. The Rio del Norte, which rises in southwest Colorado, flows along the eastern slope of the Rockies, leaving the Territory at El Paso, on the southern houndary line, where it finds its way through Texas to the Gulf of Mexico. Easterly from the Rio del Norte, and flanking it throughout its entire course, there is a lower broken range of mountains, in which many valuahle mineral deposits have also been found. This range, with the Rockies, incloses the magnificent valley of the Rio del Norte, over 300 miles in length and from 20 to 30 in width. This is the valley up which the early Spanish settlers moved until they reached Santa Fe, where they founded a city, the oldest white eettlement within the houndaries of the Union, and it was hack again down this valley that they made their disastrous retreat before the native population whom they had enslaved, as narrated in our last letter, nntil they reached El Paso, on the present Mexican frontier—a narrow pass, where the Del Norte breaks through the eastern range of mountains, as describsd above. Here the Spaniards made a stand, which they held until reinforcements arrived, when they again advancsd to Santa Fe, and where they have ever since remained. The extreme eastern portion of the Territory, like that of Colorado, is destitute of minerals—a comparatively barren plain. The extreme southeastern portion constitutes a part of the great "Staked Plain," which extends far into western Texas.

The Territory is divided into 12 counties, in every one of which more or less mineral has been found. But what has thus far proven the most valuahle mineral portion of the Territory is just south of its center, and within the eastern portion of Socorro and the extreme northwestern part of Dona Ana counties. Perhaps some of

The Most Important Discoveries,

And those which are just now attracting the most marked attention, are in the region of the Black range, a monntain range a few miles north of Deming, the point of junction between the Atchison & Topska and the Southern Pacific railroads. The locality is known as Lake Valley. The location was described and illustrated by a map in the MINING AND SCIENTIFIC PRESS of the 11th of last month. The most important discoveries there were made four years ago, and four claims have recently been consolidated into a company now known as the Sierra Plata Mining Co. The descriptions of the developments made there read much like a chapter from the "Arahian Nights' Entertainmsnt." It is stated that Ex-Governor Safford, of Arizona, on visiting the mine, offered to give $50,000 to be allowed to carry off and keep what he could extract from the mine hy his own individual lahor in ten honrs. A corrsspondent of the MINING AND SCIENTIFIC PRESS, who visited the mine in October last, saw one mass of chloride ore six feet long, fonr wide and two thick, which was valued at from $60,000 to $80,000. A large mass of ore taken out at the same time as this was sent to the Denver exhihition, where it was exhihited in a large glass case, and formsd one of the chief attractions of the exhih tion. Our correspondent writes us that there wsre some 65 tons of ore heing raised each day; that there were at least 3,000 tons on the dump which would work from $30 to $100 per ton. There were immense masses of chloride ores which would assay over 70% silver. Thsre were thonsands of tons in sight in the mine, one place which was called the "Bridal Chamher," where the ore hody was 40 ft. in depth and of unknown width. It was from this chamher that the mass sent to Denver was taken.

This property belongs to a syndicate of New York capitalists, one of the chisf of which is Geo. D. Roberts, formerly a well-known San Francisco mining operator. The company has upon ths property a 40-stamp mill, 20 crushing dry and 20 wet, huilt hy Prescott, Scott & Co., of this city. The Black range region is divided up into four or five distinct mining districts, in which are found

Many Other Valuable Mines.

Among which may he mentioned ths Bullion, from which about 50 tons of ore had heen taken up to Octoher last from a shaft about five feet sqnare, 75 ft. in depth, which assayed $1,000 to $2,000 per ton. Twenty-four tons of this ore worked at the Lake Valley mill returned $10,400. The ore is black sulphuret of silver. Joining this mine on the north, only 80 ft. from the Bullion shaft, is the Superior, owned hy a San Francisco company, of which Gov. Geo. C. Perkins ie at the head, which is just being opened with most promising results. All of these mines are resting on porphyry and overlaid with limestone. Mr. Geo. H. Hesrst, a capitalist of this city, has also recently purchassd and is now developing some very promising mines in the southern portion of the Black range. Some of the mines so rich in chlorides are giving indications of a change with depth from chloride ores to sulphide or silver glance. Passing from Dona Ana, the extreme southesstern county, we come now to

Grant County,

Which forms the sontheast portion of the Territory, and which for many years was recognized as one of the principal mineral producing counties in the Territory. Gold placers, very rich and of considerahle extent, have hsen worked in thie county, and gold washing is still carried on to some extent. The entire production of the placers sincs thsir discovery is variously estimated at from $5,000,000 to $10,000,000. This county was well represented at Denver, showing silver and copper ores in large quantities and of high grade—one specimen of which, weighing 765 lbs., attracted much attention. Qnite a numher of noted hullion producing mines were represented from this county, among them the "'76," which report says has produced over two millions in silver hy a very small working force. The Bremsn is also an adjoining and excsptional mine, carrying yellow, green and hlue chlorides, also a very curious formation of silver snlphide halls or concretions, very rich. The vein matter is composed mainly of haryta, inclosed between walls of qnartzite and lime. The mine has heen opened to a depth of 300 ft. and over. Over $1,000,000 have heen taken out. A ten-stem mill is now heing erected in connection with these two mines. The general plsn in this district is to group several mines together, erect a mill and proceed to develop. Eleven of these centers have already heen thus arranged., which will soon he opsned, and when found profitahle will he supplied with the necessary machinery for working the ores.

Copper Mines.

Copper is a very ahundant mineral in New Mexico, and the opening up of railroad facilities is already giving a new and onward impstus to this hranch of mining. Charactsristic samples from some 25 copper mines were shown, plentifully interspersed with carhonates and native copper. These mines are also heing grouped into centers for development. They are all in the neighborhood of the famous Santa Rita mine, in Grant county, which was also represented there, and which has heen worked by its present owners ahout six months. The Santa Rita is an old Spanish mine which was evidently worked for native copper only. The Spaniards took out and left upon the dump good carhonate oree to the extent of many thousande of tons. The dump covers several acres of gronnd. Its original Spanish owners do not appear to have heen acquainted with the working of even the simplest varietiss of copper ores, for they evidently confined their researches to native copper only. A 20-etamp mill, with lixviating works, are now heing put up—intended to treat from 15 to 20 tons a day. The mine is within 60 miles of the Atchison and Santa Fe railroad. Six miles from Santa Rita is the old Spanish Hanover mine, also worked some 300 years ago. The property is now held hy a Mexican patent. It has yielded largely, but is now idle. Fine specimens are shown from this mine. There are also large numhers of mines ungrouped in this immediate neighhorhood.

More Spanish Workings.

From Socorro county, adjoining Grant, some 15 minss were represented, among which were ssversl other old Spanish workings. Large qnantities of slag are found very rich in copper, also large amounts of very rough copper that had heen ohtained hy smelting, which is mst with among the slag, and may be dng out hy ths ton. A company has recsntly heen organized to work this mine, and will soon put up the necessary works.

Copper and Gold.

In Taos county, in the northern part of the Territory, a series of mines has recsntly been discovered, carrying carhonates and sulphurets very rich in gold. Assays have heen made of specimens which have shown gold over $400 to the ton and 65 per cent. of copper. These minss are located midway hetween the Rio Grande and the Texas Pacific roads—50 miles either way. Wood, timbsr and coal ahundant, and lime also ahonnds.

In Dona Ana, adjoining Grant connty on the east, there was a group of coppsr mines reprssented, showing hard carbonates and red oxides, even helow water, a massive vein. This property has recently passed into the hands of four American capitalists, who will immediately put np extensive works.

From Lincoln county were also shown carhonatss of copper, rich in gold, from a mine upon which there is a 20-stamp mill in operation—no lixivation works. The mill has been in opsration about one year.

Gen Grant's Mine.

A very fine show was made hy the San Pedro mine, of Santa Fe connty. General Grant is President of this company. The vein is very heavy in some places, measuring 35 ft. across. The uppsr portion of the vein matter is largely made up of carhonates; the lower por tion, which lies upon the under wall, is rich in sulphides. Between these two layers, and apparently continuous, is a thin layer of gold-hearing snlphurets—rich enongh, so far as explored, to pay the entire running expenses of the mine.

Bernalillo County

Sitnated nsar the center of the Territory, sends some splendid specimens of copper, all through which ie found small nuggets or concretions of native copper, varying from nut size to those of sevsral pounds. These aggregations are very curious and interesting. They are imhedded in carhonates. The vein evidently once consisted of masses of native copper, which are gradually hecoming decomposed and changed to carhonates. Large amounts of peacock ore are found in the westsrn and central portions of the Territory of New Mexico. Csrusite and malachite also occnr in smaller quantities in nearly sll the mines shown.

The San Pedro and Del Aqna Company, in this county, have two 30-ton smeltors in operation, and a 25-stamp mill. Very rich placers have been discovered in the San Pedro mountains, a short distance from Alhuquerque. One company has ordered 13 miles of 14 inch iron pipe for the purpose of conveying water from the Pecos river for sluicing purposes. The placers are quite extensive, and very rich. Another company is now horing an artesian well for the purpose of ohtaining water for sluicing. They expect to go down 3,000 ft.

Santa Fe County.

Mining in this county—the emallest in the Territory—was commenced hy the Spaniards some 300 years ago. The remains of old mining work are frequently mst, inclnding reduction works of rude constrnction. The Los Cerillos is the most important mining district in the county. It contains a large number of valuahle mines, some of which have hsen opened from 200 to 300 feet or more in depth. There is a large extent of valuahle placer ground in the sonthern part of the county. Valuahle mines are also found in several other localities in the State, to which we have not room for reference. Reference might also he made to the occurrence of other ussful minerals. But a very small portion of the Territory has as yet heen prospected.

A Turquois Mine.

We cannot close this lettsr, however, without a hriof referencs to the famous turquois mine near Santa Fe, prohahly the most extensive and the largest worked mine of that mineral on the globe. It had evidently been worked for centuries before the Spaniards made their appearance in Mexico. The irregular openings in the monntain made hy the ancient Aztecs in their search for this precious mineral are called "wonder caves." When the Spaniards came they took possession of the mine and worked it for nearly a century with a large force of natives. It is said that an extensive cave in this mine, which killed a great numher of natives, was the immediste cause of the uprising in 1680, which drove the Spaniards from the county. Having no space in this connection, we shall at some futnre time give a detailed report of this mine and the mineral for which it is worked. We can now merely say *adios* to this interesting and important mining region hy merely referring to the fact that a large emigration is setting in towards New Mexico, and grand opportnnities are there presented for capital and lahor. The prophecy of Hnmholdt, that the wsalth of the world wonld some day he fonnd there, is fast heing realizsd, not only in mining, hut in every other hranch of industry as well. Her majestic mountains, sublime scenery and healthful climate will ever he songht for, enjoyed and utilizsd by the industry, intelligence and wealth of the world.

W. B. EWER.

VALUE OF STRICT TECHNICAL SCIENCE.—In the prosecution of technical, and more especially of purely scientific inqniries, hy the aid of instruments of precision the value of the observations is messured largely hy the mastery which the investigator has over every detail and condition of his apparatus and his work. The annals of sciencs contain numerous valuahle discoveries which we owe to the devoted application of some patient yet zealons ohserver. The instruments he employs may be unexcelled in workmanship, yet in other hands thsy would yield hnt indifferent resnlts. The value of such lahor, when successful, is not measured hy dollars and csnts alone. It has an influence on gsneral progress of a lasting and of ths most salutary character. The work of comparing standard bars, including thoss used in connection with the Hartford comparator, undsrtaken by Prof. Wm. A. Rogers, of the Harvard ohservatory, is worthy of special mention in this connection. Prof. Rogers has brought to this work the ripe experience of long practice of his profession. He has condncted a protracted series of delicate ohssrvations with a commendahle zeal and high degree of success. The results are of intersst to engineers and mechanics everywhere, snd Prof. Rogers is to be congratulated upon his valuahle services in promoting an important step in the progress of mechanical constructior.

BALTIC QUARTZ MINE.—The 10-stamp mill of the Baltic company, in Eureka township, is completed, and steam was started up for the first time on Saturday last, when everything worked smoothly. Mr. E. F. Morse, superintendent, has had charge of the construction of the mil', the work heing done by Wm. May, one of the most experienced millwrights in the State. The machinery for the mill was from the foundry of George G. Allen, of Nevada City. The nower ie sufficient for a 20 stamp mill, hnt only 10 stamps have heen put up for the present. Beside the mill there will be an extensive woodshed erected adjoining, so as to have the wood under cover dnring the winter months, as that is a snowy region, the snow falling at times to a considerable depth. With the huilding of this strnctnre the mill improvements will have heen completed, snd work can be continned through the present winter without interruption. D. N. Coffin will he the foreman of the mine, and has heen very husy for some time in opening it and getting qnartz on the dump ready for the mill when it was finished. All the carpenter work ahout the mill will be completed hy Christmas. —*Union.*

SAVAGE AND NORCROSS.—The drift which is bsing run jointly hy the Savage and Hale and Norcross companies is being pushed ahead hy three shifts of nine men each. The drift starts from the end of the drift run north hy the Chollar Company on the 2,600 level, just previous to their starting their south drift. This north drift was started 436 ft. west of the Chollar-Norcross-Savage shaft, and run north 102 ft. The savage and Norcross folks will now run it up to the Savage south line. It will pass to the west of the winze which is down from the 2,400 level of the Hale and Norcross to a point some 25 ft. helow the 2,500 level. In case a circulation of air should become necessary while running the drift, a connection will he made with this winze, hut a sufficiency of air c n doubtless he carried in through a pipe to enable the men to push the drift to the Savage. The ground in the face of the drift is dry and hlasts well.

THE OLD MINING CAMP OF COMO.—The old camp of Como is waking up. The whistle of the hoisting works lately put np on the Eureka mine hlew its hlast for the first time in Como on Thanksgiving day. The Eureka company is sinking a three-compartment shaft on its ledge. A good hody of ore, 18 ft. thick, has heen developed, and it assays as high as $600 per ton. The mine shows the real Comstock ore. The Headlight company is driving its tunnel with two shifts of men, with a good prospect of developing a paying hody of ore. The ledge on the surface is 15 ft. wide, and the croppings assay $20 a ton. We predict a lively time for Como in the spring. This camp heing so near Virginia, and the ore so far developed showing the charscteristics of Comstock ore, many mining men have no hesitation in saying that it is a continuation of the Comstock lode.

RUSSELLVILLE.—The Peahody and adjacent minee are still shut down. The ehort-sighted policy of the directors of a valuahle mine is, as we have already noticed in our colnmns, inexplicable. We hear from Mr. Wall, superintendent of the company, that there is no likelihood of operations heing resumed hefore the new year, and if then, only prohlematical. This property should he owned hy men of a very different stamp than the present owners and directore—at least for the benefit of the district.—*Tombstone Epitaph.*

TURQUOIS DISTRICT.—We learn from this camp that assessment work is heing actively carried on at the Mono, Treasure and other claims. Professor Blake's late visit to this camp is to form the subject matter for a letter to the Mining Report. He was not fully satisfied as to the value of this district, reminding him, as it did, of the Turquois district in Mexico, which he visited last year. When the article in question appears we shall draw attention thereto.—*Tombstone Epitaph.*

A Rich Copper Region.

A correspondent of the Virginia *Enterprise*, writing from Luning, says: This part of southeastern Nevada still progresses. Two car-loads of bullion was this day shipped from the Downeyville mines. Very rich silver ores are arriving from the Yellow Jacket mine, Gillis Mountain district, assays of which run as high as $3,200. This mine is about six miles east of this place. The deposit is "piled" with sacks of ore to be shipped to the Castle Dome mining and smelting company, of Melrose, California.

Santa Fe Copper Mines.

The copper interest of Santa Fe district, six miles east of Luning, promises to become of great magnitude. New discoveries of copper ore are daily reported. The Illinois company are staying with the good old ship, and have stripped and run an open cut for a distance of 800 ft. north and south. They have also stripped the ledge with an open cut a distance of 63 ft. east and west and 25 south of the discovery monument, exposing a large body of red and black oxids of copper, showing assays of from 37% to 59%. They have sunk a vertical shaft 50 ft. through the ledge and run a crosscut southeast 40 ft., striking the west granite wall. At the head of the crosscut the ore is black oxide, assaying 42%.

Another New Development

Has been uncovered during the last few days in the Head Center copper mine, situated 1,200 ft. southeast of the Illinois mine. The ledge has been on the surface of 40 ft., showing black and red oxide, assaying up to 46%. There is ore enough in two mines to run two 50 ton furnaces for a year without any extra outlay excepting for labor and powder.

The combination of ores in these two mines is wonderful, showing peacock, malachite and black and red oxides of copper. These ore veins are contact, and inclosed in granite on the west and lime on the east. They have a north and south strike, and dip to the west in the first 50 ft. This rich copper belt extends about 15 miles north and south, and 10 miles east and west. Specimens are being brought in by miners that show native copper. All these ores of copper can be worked in a water jacket furnace, and the great desideratum in smelting, English coke, can be had at reduced rates for freight by the Carson and Colorado railroad.

A Coming Camp.—Quite a number of persons on the Comstock, says the *Enterprise*, intend pushing to the front as soon as the Carson and Colorado railroad is completed to Benton, which will be in a few weeks. The climate in that valley region is very fine, and there is an abundance of room for all who desire to settle down in that section. Business will make business. There will soon be an opening for all trades and professions at Benton and at other points in that region. Prospectors are beginning to scout up into the mountains by which the valley is walled in on the east and west, and already some very rich discoveries are announced. A very rich gold discovery has recently been made in the vicinity of the White mountains. The north peak of those mountains tower to such a hight that everlasting snow fills the ravines near the summit on the northern slope. This is what in California would be called a "butte." Such "buttes" quickly attract the eye of the prospector. Where a section of country is pushed up to such an immense hight the miner seldom fails to find that it brought up with it something valuable in the way of mineral. Good veins are generally found upon the flanks of such great peaks, and most frequently at points where they are joined by the surrounding hills. It is seldom that anything of value is found upon the higher parts of the buttes themselves. They are generally only huge masses of granite.

Yavapai Ores.—As a general thing in northern Arizona ores upon the surface are free milling, and so long as the ore remains such in going down upon the various mines which have been worked good results were achieved, but so soon as water level is struck and sulphurets appear the ordinary machinery in use fails to save the metal and suspension of operations is necessary. In every instance, without a single exception, assays show the sulphuret ores to be the richer; hence the only thing necessary to make mining a success in all this section is the proper machinery for the treatment of rebellious ores. Experienced men to operate the machinery necessary for properly treating base ores is also very essential. Mining, like other things, must be dealt with intelligently, and because one run upon certain ore fails to pay it does not necessarily follow that another run will not. A farmer may make a failure in his crop one year and the next have beneficial results. A freighter may make one trip to Salt river at a loss and the next at a profit, and so it is with mining. Good management and favorable circumstances have much to do with the treatment of ores. Yavapai ores the deeper down in mother earth the richer they prove to be, and the verdict of those best calculated to judge tell us that nowhere in the United States is to be found such a number of rich mines as here in Yavapai county.—*Arizona Miner.*

Extensive Iron Works, to be established at Victoria, B. C., are spoken of, in anticipation of the market to be opened by the construction of the Canadian Pacific Railroad.

Useful Information.

The Decline of China.

The correspondent of the London *Times* at Shanghai says: "There is every reason to believe that China has fallen off enormously in wealth and population during the last 50 years. The last complete census of the Empire, taken in 1812, gave a total of 360,000,000. Since that time there has been an internecine civil war, which caused the death of 30,000,000 of people, while other wars have also made serious inroads, so that by many it is thought the population cannot now exceed from 250,000,000 to 300,000,000.

By law every province ought to make an annual return of population, but this seems to have fallen into desuetude. Only one province so far has resumed the practice, viz: Chekiang. In 1812 this province stood for 26,257,000, and it is now reported as containing only 11,570,000 inhabitants. Chekiang is a very fertile province, and the center of the silk industry, so that the population might be expected to fill up by immigration more rapidly than in other places. If, therefore, notwithstanding all these advantages, the population in this one province has decreased by 15,000,000, it is not unreasonable to suppose that the falling off over the whole eight or ten which are known to have suffered is at least 100,000,000, and that the present population of China does not exceed 250,000,000. The returns of land tax payable are further confirmatory of this conclusion. In 1812 the land tax payable in Chekiang was 5,850,000 taels; now it stands at only 2,120,000 taels. It is said that ever since the Taeping rebellion the financial prosperity of the country has steadily declined. Though the officers of the Government have striven in every way to raise revenue, the receipts of the public exchequer are more insignificant that ever, and the people are in a state of poverty that has no precedent in the history of the Empire. Under these circumstances we cannot wonder at Chinese emigration.

Magnetic Purification of Porcelain Paste.—There is a difference in commercial value of 40 per cent. between pieces of porcelain which are absolutely white and those which present the slightest spot. The spots are produced by small quantities of ferruginous matter, of which the chemical composition is not well known, but which can be attracted by a magnet. Many attempts have been made to use magnets systematically, but they have hitherto been unsuccessful. Two French establishments have lately employed the following method with very satisfactory results. Each electro-magnet is composed of two coils placed in a line; their remote ends are connected by a long piece of iron; the two near ends are but a short distance apart, one representing the north pole and the other the south pole of the electro-magnet; between them there is a magnetic field which can be made very powerful, provided there is a sufficient exciting current. A tight box encloses this magnetic field; it is open above, and has a round opening below into which an escaping tube is inserted. The porcelain paste, very liquid, running into the box, encounters a small zinc diaphragm which sends it to the right and to the left over the polar faces; the magnetic particles are retained and the rest escapes. The polar surfaces are cleansed twice a day by a jet of water. The apparatus may be worked either with a Gramme machine or with a battery.—*L'Electricien.*

To Test Glue.—An article of glue which will stand damp atmosphere is a desideratum among mechanics. Few know how to judge of quality except by the price they pay for it. But price is no criterion; neither is color, upon which so many depend. Its adhesive and lasting properties depend more upon the material from which it is made, and the method of securing purity in the raw materials, for if that is inferior and not well cleansed the product will have to be unduly charged with alum or some other antiseptic, to make it keep during the drying process. Weathered glue is that which has experienced unfavorable weather while drying, at which time it is rather a delicate substance. To resist damp atmosphere well, it should contain as little saline matter as possible. When buying the article, venture to apply your tongue to it, and if it tastes salt or acid, reject it for anything but the commonest purpose. The same operation will bring out any bad smell the glue may have. These are simple and ready tests, and are the ones usually adopted by dealers and large consumers. Another good test is to soak a weighed portion of dry glue in cold water for 24 hours, then dry again and weigh. The nearer it approaches to its original weight, the better glue it is, thereby showing its degree of insolubility.

A New Wheel.—An Italian has invented a new carriage-wheel, in which the iron rim is united to the hub by semi-circular slat spokes. The curvature allows them to serve both as spokes and springs. The result of experimental trials is said to have surpassed the anticipations of the inventor. In great speed, especially, the irregularities of the road produce no shock. Elasticity, solidity and complete absence of noise are enumerated among the special advantages of the new invention.—*Les Mondes.*

Improvement in Piano Construction.—A Manich inventor has brought forward an improvement in the construction of piano-fortes, which, it is claimed, meets the problem of equalizing the strength and fullness of the different octaves. A series of tuning forks are freely suspended over the three highest octaves of the piano, each fork having the exact pitch of the string over which it is suspended. The vibrations of the string are communicated to the fork, which, in return, reacts on the string, and thus a full and sustained tone is secured, in strong contrast to the usual short and dry tones of this instrument.

Strength of Different Kinds of Hemp.—Careful experiments made at the cordage works of Messrs. Frost, of Shadwell, Eng., and reported in *Iron*, give the following figures as the results of the trial. The experiments were made with fifty yarns of each kind, all spun 25 thread, and with the same machinery. Five tests were made with each kind, and the averages breaking weight of each given as follows: Manilla, 2,459 lbs.; Italian, 2,212 lbs.; New Zealand, 1,433 lbs.; Sisal, 1,280 lbs.; Russian, 1,228 lbs. It will be observed that the strength of Manilla hemp is more than double that of Russian. The experiment is a very interesting and useful one.

To Fasten Brass to Glass.—Everyone who uses brass letters on glass windows, and knows how often they drop off from unequal expansion or from the too energetic efforts of window cleaners, will be glad to have the following recipe: Litharge, two parts; white lead, one part; boiled linseed oil, three parts; gum copal, one part. Mixed just before using this forms a quick-drying and secure cement.

Experiments have recently been made in Sweden of crushing blast furnace slag into sand, to be utilized for road and railway making, etc., and a machine has just been constructed by the Ringehytton Iron Works, which is stated to be very effective in the preparation of the material.

A Universal Rule.—As the strength of a chain is equal to that of its weakest link, and the carrying capacity of a water pipe equal to that of its smallest part, so the conductivity of an electric current is only equal to that of the part which offers the most resistance.

A Paper Knife.—A knife for cutting paper has been recently patented. It has bearing-points, and a raised handle between these points, and is made of elastic material so that pressure on the handle will elevate the point of the blade.

Good Health.

Digestibility of Breadstuffs.

The digestibility of bread is largely dependent upon its greater or less porosity, as produced by the material used and the treatment in making. The more gluten the bread holds the more porous it becomes, and, as a matter of course, the less it contains the more compact it will be.

The cereal richest in gluten is wheat, rye being considerably inferior in this respect. Among the non-nitrogenous food elements of grain is the starch flour, which, in the process of baking, is transformed, in the crust of the bread, into dextrine and sugar. The outside of the loaf for this reason is much more digestible than the interior. It is quite commonly admitted that an admixture of bran with flour renders the latter much easier of digestion. Those who have given thought to the subject advise a proportion of bran to flour as one to four. The slightest comminution of the grain, as well as the amount of husky portion retained in the well-known graham flour, produces a slight irritation of the digestive organs, which results in separating the pepsin from the husk of the grain, and admits of its mixture with the gastric fluids, thus greatly facilitating the process of assimilation. This mechanical irritation, particularly in the cases of the aged and weak, can only be otherwise produced by the use of alcoholic and similar stimulants, the effect of which is only temporary, and, for the most part injurious.

Bread should not be made without salting, for the reason that the starch of the flour contains a large amount of the salt of potash, which neutralizes much salt in the system. Aside from its porosity, the amount of water contained by bread is an important matter when viewed from a hygienic standpoint. Dry bread which has been baked some little time is most healthful, as the chewing process must of necessity be thorough and the bread consequently fully salivated previous to its entrance into the stomach. Fat is present in moderate quantities in cereal bread; wheat contains 1 1-5, rye 1 3-5, and corn 4 4-5%, from which it may be seen that flour made from corn is best adapted for the use of those persons engaged in heavy work. Those, on the contrary, who have little manual exercise are best suited by the wheat flour, in which there is little fat. But since the human system demands a small proportion of digestible fat, the mixture of the dough of bread with milk is urgently recommended as furnishing the needed element in its most digestible form.—*Translated from the Walzen Mueller.*

Fat of the Old and Young.—The influence of age on the chemistry of the body is a department of physiology as yet very imperfectly investigated. The composition of the fat, however, at different periods of life, is obviously one of the simplest problems connected with the question, and it has been lately investigated by Lanquer. In newly-born children the fat has a particularly firm consistence, constituting a peculiar tallow-like mass, with a melting point of 45° C. (114° F.) The fat of adults separates at the ordinary temperature of a room into two layers. The upper layer is completely fluid, translucent and of a yellowish color, and only solidifies at temperatures under zero, Centigrade. The lower layer is a crystalline mass, which has its melting point at 36° C. Further investigations were made on about a kilogram of each kind of fat. The fatty acids obtained from the fat of unwly-born children (after precipitation with hydrochloric acid) were found to melt at 51° C., and those obtained from the fat of adults had a melting point of 38° C. The former was found to contain three times as much palmitic and stearic acid as the latter. The palmitic acid preponderated over the stearic in each kind of fat, but much more in that of children than of adults, the proportion being in the former four to one, but in the latter nine to one. There are 86% of oleic acid, 8% of palmitic acid and 2% of stearic acid in the fat of an adult, whereas in the child the proportion of oleic acid is only 65%, the palmitic acid 28%, and the stearic acid 3%.

Does Smoking Injure the Memory?—This question is answered by the *Herald of Health* as follows: Concerning the Abbe Moigno, an aged man, who possessed a remarkable memory, some practical facts and hints as to smoking and study have just been published. Before he ever commenced the use of tobacco he learned 12 foreign languages, and stored in his mind an immense number of historical, geographical and general facts. Whenever he wanted to recall the meaning of a word or the date of an event, he had no difficulty in doing so. As to philology and chronology, he was one of the most extraordinary characters of his time, and Francois Arago used laughingly to threaten to have him burned as a wizard. In course of time Moigno fell into the habit of snuff taking, and after associating with some Bavarese scholars he attained to smoking three or four cigars a day. "One day," says he, "I was painfully surprised to have to recognize that I was constantly obliged to turn to my dictionaries for the meaning of foreign words, which before happened to me seldom, or never, and that the dates of numerous facts which I had made my own had fled from my memory." The sufferer made a resolution that he would give up the use of tobacco, and he said: "It was for me a complete resurrection, not only of the memory, but of the general health and well-being."

Effects of Liquors.—Cheap brandy and absinthe are the cause of a large proportion of cases of insanity in parts of France. The United States Consul at La Rochelle, in his report on French brandies, points out the fact that no pure brandy is now made in Cognac and the district adjacent. He says that German alcohol, distilled from potatoes, is imported, doctored and sold for brandy, and that the French artisans and peasants, who formerly used light wines, have of late years used much of this so-called brandy. He says: "Its characteristic effect is to produce an intoxicaton in which the patient is inclined to rage and physical violence, while hopeless insanity is the inevitable consequence of persisting in its use, even for a relatively short period of time." It is at least worth the physician's while to know that there is no such thing as pure Cognac now.

Contagiousness of Consumption.—Fresh proof of the danger of inhaling air exhaled by persons with lung diseases has been given by the curious experiment of M. Giboux. He took four young, healthy rabbits from the same litter, and kept them for 105 days in cages, as follows: Two were placed in a cage where they were obliged to breathe the air expired from animals with consumption, twice a day for two hours. In a short time they became sickly, and, on killing them, they were found to have tubercles in the lungs. The other two breathed twice a day the same air, disinfected by being passed through cotton wadding impregnated with carbolic acid. These rabbits remained in good health, and were finally eaten by the experimenter.

A Valuable Medicinal Plant.—During the French invasion of Mexico a plant was discovered which was found to possess the property—when chewed or crushed—of stopping hemorrhages. To the native Mexicans this plant was known by a name which may be rendered as "fowlwort." The discoverer carried a specimen to Versailles and planted it in 1867, and it has since flourished, flowered and fruited without apparent change in its peculiar qualities. The action of this plant is said to exceed that of all styptics known, and this valuable property is likely to give it a wider extension, especially as it seems to be so readily acclimated in foreign lands. Its botanical name is *Fradescantia erecta* (Jacq.)

SAN FRANCISCO:

Saturday Morning, Dec. 30, 1882

TABLE OF CONTENTS.

EDITORIALS.—A Progreesing Establiehment, 417-Paeeing Events; Health of Minere; Cloee of the Vol. ume; Apparatue for Reducing Oree; Mining Company Investigations; Injurious to Mining Interests, 424. Shore Scene at Santa Cruz; Hoisting Appliancee, 425. Patente and Inventione; Noticee of Recent Patente, 428.

ILLUSTRATIONS.—Tatum & Bowen's Quartz Mill and Sawmill Engine, 417. Natural Bridge on the Coaet near Santa Cruz; Scene on the Santa Cruz Coaet, California, 425.

CORRESPONDENCE.—Notes from Eureka, Nevada; Shasta County Mines, 418.

MECHANICAL PROGRESS.—The Antiquity of Caet Iron; Heavy Iron Work; Ruhher Paete for Driving Belts; About Patents; A Rolling Mill Challenge; Iron Shot; A Steam Wheel; An Irou Man, 419.

SCIENTIFIC PROGRESS.—An Artificially Smooth Sea—Interecting Experiment; The Great Ruesian and the Lick Teleecope; Has the Earth a Fluid Nucleue; Cauee of Scintillation; Solar Heat; Rotary Electric Coefficients of Metale; New Uee for Cotton Seed Oil; Carrying Capacity of Electric Wires, 419.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Assessments, Meetings and Dividende, 420.

MINING SUMMARY from the various counties of California, Nevada, Arizona, Idaho, Montana and New Mexico, 420-21.

USEFUL INFORMATION.—The Decline of China; Magnetic Purification of Porcelain Paete; To Test Glue; A New Wheel; Improvement in Piaco Conetruction; Strength of Different Kinds of Hemp; To Fasten Brase to Glass; A Universal Rule; A Paper Knife, 423.

GOOD HEALTH.—Digeetibility of Breadetuffe; Fat of the Old and Young; Doee Smoking Injure the Memory; Effecte of Liquore; Contagiousnees of Conеumption; A Valuable Medicinal Plant, 423.

NEWS IN BRIEF—On page 420 and other pages.

MISCELLANEOUS.—Food Adulteration; Formation of Ore Veins; A Model for Young Men, 413. Value of Strict Technical Science; Baltic Quartz Mine; Savage and Norcroee; The Old Mining Camp of Como; Ruesellville; Turquois District, 422. A Rich Copper Region; A Coming Camp; Yavapai Oree, 423.

Business Announcements.

Lubricating Oils—Tatum & Bowen, San Francisco.
Oil Feeders—Paine, Diehl Co., Philadelphia, Pa.
Factory Buildinge—C. G. Yale, San Francieco.
Dividend Notice—German Savings & Loan Society, S. F.
Harmon Seminary—S. S. Harmon, Berkeley, Cal.

Passing Events.

The "passing event" of this week is the passing away of the year 1882. And it is, therefore, in order for us to wish our readers "A Happy New Year," and to close our volume preparatory to beginning our labors with renewed efforts. In another column we speak of Vol. XLV and what we intend to do with Vol. XLVI, our index, published this week, showing in detail what we have just accomplished.

There are no special features to note in the mining situation. No new discoveries of startling character have recently been made, but the miners are working away everywhere with contented lot, knowing that work tells.

The miners this week are specially busy doing their annual assessment work. On Monday there will no doubt be thousands of relocations of claims which careless or thoughtless miners have left. This is always an era of lively work and of new discovery, and we hope ere long to chroniole a long list of "strikes" made by the "honest miners" of the coast.

THE Department estimates for the Appropriation bills in course of preparation by the House of Representatives are in amount as follows: For pensions, $101,575,000; fortifications, $1,000,000; navy, $23,481,078; legislative, executive and judicial expenses, $21,840,170; sundry civil expenditures, $34,181,376; District of Columbia, $775,149.

Close of the Volume.

This number of the MINING AND SCIENTIFIC PRESS closes Vol. XLV. We flatter ourselves that the volume has given satisfaction to our readers and has benefited them. The mining interests of the coast were never before in so prosperous a condition as now, and never were so many engaged in mining as a legitimate business.

The mining field has widened within the past few years to a greater extent than was ever dreamed of. Thousands of persons following other occupations have now become miners.

It is our endeavor to represent this important class of the community, and collect for them all the information which will be either of interest or value to them. Aside from the general mining news given in each issue, we have paid close attention to all new processes or mechanical improvements which are of value to miners or metallurgists. All the necessary details of such things have been given, and, where practicable, illustrations have been published also. We do not consider it necessary to call attention in detail to the work we have done for the mining community during the year, as it speaks for itself, but it is not out of place at this time to impress upon miners generally the fact that they cannot afford to do without a paper devoted to their special interests, and they should do all in their power to enhance its value and its usefulness. It should be brought to the attention of other miners and be circulated wherever possible. The information in its columns, collected from home and foreign sources, is of far more value than the mere price of subscription.

In our mining summary we give from week to week the current news of all the mines and mining districts in the different States and Territories where precious metal mining is carried on. This, given in a condensed form, is an epitome of mining industry. Our departments of mechanical progress, scientific progress, engineering, useful information and good health, are all replete with valuable facts for our readers. The illustrations have been characteristic, and have been more particularly connected with mining interests. It has been our endeavor to show in this manner to miners all the new things which might be useful to them in their business.

The copious index which is given on the last page of this issue is a reminder for the reader of the fact that the volume of the PRESS is a treasury of much useful information, suggestions and earnest thoughts of life and purpose. This can not well be otherwise, for many are the pens which have flown in our service during the past six months. To the very many subscribers who save their papers carefully the index comes as an aid to reference, and they may now close and bind their files, confident that they possess the key which will open to them desirable things.

The PRESS enters upon the work of a new year with renewed energy, and possesses advantages which our work hitherto has given for us. It is our ambition that every column of the paper shall contain something in thought or fact of real value to our patrons. Our work is done with great care and watchfulness upon all sources whence information can come upon the industry in the promotion of which we are engaged. We seek for those things which are good and useful, and which have in them the quality of true success and progress. We believe that the labors we undertake are for the benefit of the community, and result in more general good than the most labored treatise issued.

We propose to publish a greater number of original illustrations during the coming year. Next month we shall issue a double-sheet edition devoted to the interests of Southwestern Nevada, containing references to the numerous mining camps which are within reach of the Carson and Colorado railroad. We shall also in January give an extra issue containing tables of rainfall at the prominent towns of the State for a number of years past, with other statistical matters valuable for reference. Our mining review of 1882, which will appear next month, will give a retrospect of the doings of the year, with full statistical tables of the bullion production of the States and Territories and the various mining camps. This review will also be useful to miners everywhere for reference. It will be the aim of the publishers and editors to make the PRESS progressive, and to keep it, as it has always been, in the lead of papers devoted to the mining interests.

Apparatus for Reducing Ores.

A couple of years since James Bujac, of Catonsville, Md., and Wm. W. Eaton, of Hartford, Conn., invented an ore furnace and reducer, consisting of one or more hydro-carbon retorts and a closed ore cylinder, with suitable valves, connections, doors and heating appliances, [so that ore placed in the cylinder may be kept from atmospheric contact and heated to a high temperature, and hydro-carbon gases evolved] within the retort may be taken in their nascent state directly into the said ore cylinder and passed through the same for the purpose of reducing the ores contained therein. We gave in the MINING AND SCIENTIFIC PRESS at the time a description of the process.

It was found by practice, however, that except with the most skillful manipulation and under favorable atmospheric conditions, the hydro-carbon gases produced and applied as stated sometimes fail of their full effect, or are only partly efficient in the reduction of ores, by reason of their having been imperfectly evolved or having undergone some deleterious change in passing from the ore cylinder, or from other causes.

Some improvements have lately been made in the process, or rather in the apparatus, for carrying out the process. The new apparatus is so far automatic in its operation as to obviate the necessity for very great skill in its manipulation, and the inventor thinks that now it effects a thorough and complete deoxidation and reduction of ores on the same general principles as the apparatus first tried.

The improved apparatus consists essentially of one or more retorts for the distillation of hydrocarbons, a digester consisting of an oven or chamber containing carbons, through which the gases are conducted from the retort or retorts, a superheater consisting of a furnace and one or more coils or pipes through which the gases are then conducted, a closed cylinder adapted to contain ore and exclude the atmosphere, and valves and connections by means of which a continuous current of the digested and superheated hydrocarbon gases may be passed through the closed cylinder and contained ores.

A continuous current of the nascent and thoroughly evolved and heated gas is passed through the heated ore in the closed cylinder, the passage of the gases being properly controlled by cocks, and the pressure within the ore cylinder suitably regulated. By means of the combined apparatus it is claimed that an entire and perfect reduction of the ore is effected without the use of the crusher or stamps, and the apparatus is so nearly automatic in its operation that it does not require the care of a highly skilled operator, but may be used and manipulated by any person of ordinary intelligence.

Mining Company Investigations.

A short time since the San Francisco Stock and Exchange Board appointed a committee to investigate the condition of mining companies listed on the Boards. The original investigating committee consisted of M. J. McDonald, J. M. Goewey, Coll Deane, M. P. Hall and R. F. Rogers. At a meeting the other day it was decided to increase the committee, and the following were added: J. M. Shotwell, S. Dixon, S. B. Boswell, J. L. King, W. Turnbull, H. H. Shinn, E. Cahill, W. E. Hale, J. Makintosh, A. F. Coffin.

The committee have already called attention to irregularities in one or two companies, a fact which has provoked some sharp criticism of the committee, as might have been expected. Still, if the members persevere in their efforts honestly and with activity, they can do much good. If they drive from the Board such companies as are badly managed, people will have much more faith in those that are left.

The committee met Senator James G. Fair by appointment on Wednesday morning.

Senator Fair again reiterated his desire to aid the committee in all that was likely to restore confidence, and said that the management of the mines under his control was open to their investigation; that the future of the north end mines was full of hope. The water belt had unquestionably been passed, as all the water now came from above. The superintendent of the mines was most hopeful, but his firm had been so often deceived by the prospects that they did not feel like taking hold of the stocks as they would if something tangible was found. The committee ought to meet all the mine managers in this spirit, and not antagonize them by reckless charges. They should all get together and agree upon something to restore confidence and raise values.

UNTIL lately copper deposits were entirely overlooked by prospectors in the search for the precious metals. They were not worth locating. Now, however, they are eagerly sought for. A good copper mine is a valuable property.

IRON is selling in Liverpool at £97 10 for cash parcels of Straits and Australia.

Injurious to Mining Interests.

An Eastern newspaper, which pretends to give some considerable attention to mining matters, and in fact sets itself up as an authority, makes so many blunders as to be really amusing. It recently sets up the Sierra Grande mine, Lake valley, N. M., as the "richest mine ever opened in America," giving as a reason that "inside of six months nearly a million dollars were taken out, with five million more in sight." The Con. Virginia and California mines for months and months consecutively paid each $1,080,000 in dividends to their stockholders. There are dozens of other mines which might be mentioned as having turned out nearly a million in one month, to disprove the statement of the journal alluded to. The same paper credits the Standard Con. with having paid in dividends in the aggregate $40,000 per share.

Such statements are mere "bosh," to use an expressive term, and only bring into ridicule the journals that give them birth. The fact of the matter is, that since the people east of the Rockies began to think there was something in mining, a lot of papers have sprung up in the different moneyed centers devoted to the mining interests which publish all sorts of nonsense on the subject. They take hold of the matter with a confidence refreshing to behold, and, being unaware of their own ignorance, bring forward statements and opinions which, to say the least, are startling. To judge from some things we read, we should imagine that many of the editors never saw a mine or mill, and were never deeper underground than the cellar would lead them in their lives. If the influence of this class of journals was only negative it would not make much difference, but people are very often misled into operations which should not be touched. It is apt to be the case also that where mining operations of doubtful character are to be carried out, the influence (?) of some of these journals is on the side of such operations. Skillfully worded prospectuses are published and stock operations "floated" which bear no relation to legitimate mining whatever. Within the past six months several of these papers have ceased to exist, but several are still alive. It behooves all who are interested in legitimate mining to discourage such sheets, and to uphold the mining journals, which exercise an influence for the advancement of the mining industry of the country.

Health of Miners.

It is evident that the greatest necessity for healthful mining is good ventilation. With air currents sufficient to carry off noxious gases, powder smoke, and at least the most of the dust, mining becomes not merely a healthful but an agreeable occupation, notwithstanding all that has been said about its perils and drawbacks. The latter may seem a bold statement to those whose experience in mines is limited to a single visit, but it is the testimony of the great majority of miners, and is confirmed by the well known fact that men who go from farms and shops to work for a season in the mines rarely go back to the old work. There is something about the comparatively free and easy life of the miner, who is to a great extent his own boss, the uniform temperature, which in most mines varies little, if any, with the seasons, and which ranges from 45° to 65° Fahr., according to local circumstances, the year round, and perhaps the spice of danger which is always present, that makes the miner, once initiated, cling to that work the rest of his life. Nor is that life necessarily a short one, though the appalling frequency of easily avoidable accidents reduces its average length far below that it should be. No comparative statistics of the average length of miners' lives, or of their liability to disease, have ever been published, but old men are common among them, and are still hale and hearty for their age. Their principal diseases, as before stated, are miner's asthma, consumption and rheumatism, and among those who have worked long in badly ventilated places, dyspepsia, tremors, vertigo, and other troubles arising from blood poisoning. The two principal causes are dampness and bad air. Pumps and precaution obviate the one and proper ventilation the other.

It is the opinion of Dr. J. T. Carpenter, of Pottsville, formed from long personal acquaintance with the subject, and sustained by the almost unanimous testimony of practicing physicians, mining engineers, colliery owners and miners themselves, that were it not for accidental injuries and deaths, the mining class would show as good average health, as fair a percentage of longevity, and as low a death rate as another class of manual laborers; that the hygienic conditions of American mines are receiving more attention and consequent improvment year by year; and that if the average miner could only be taught to exercise caution and common sense about his work, the list of fatal accidents would be materially shortened, and mining would lose most or all of the terrors which now invest it in the minds of the general public.

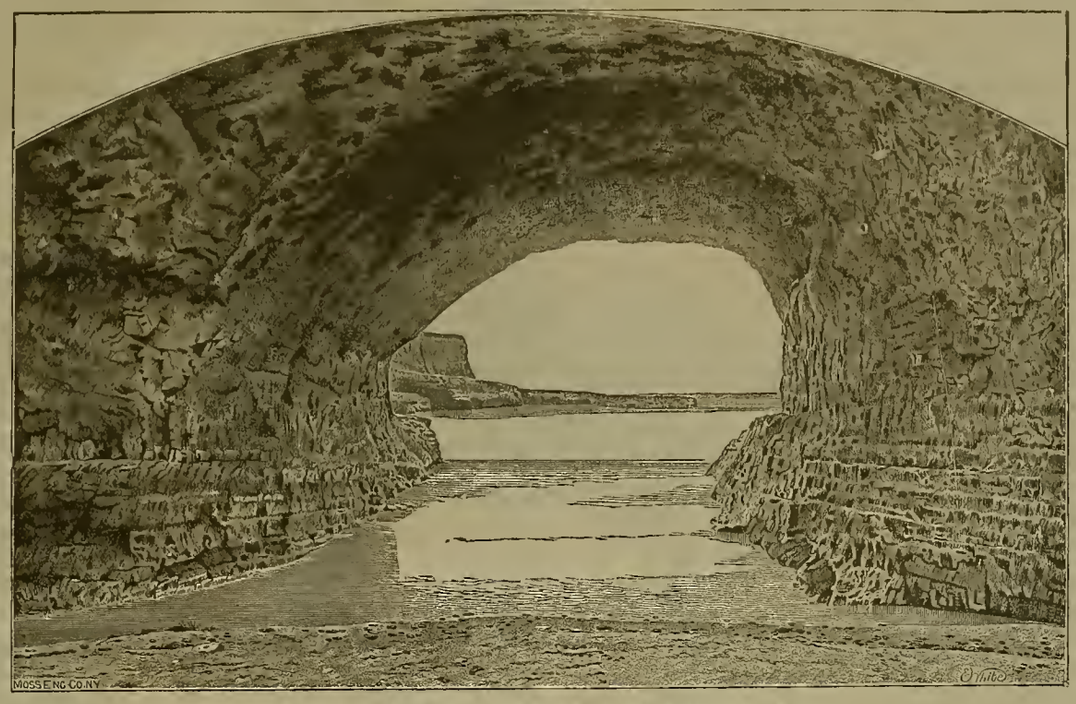
ANTIMONY sells in Liverpool at £43 to £45 per ton for French Star regulus.

Shore Scenes at Santa Cruz.

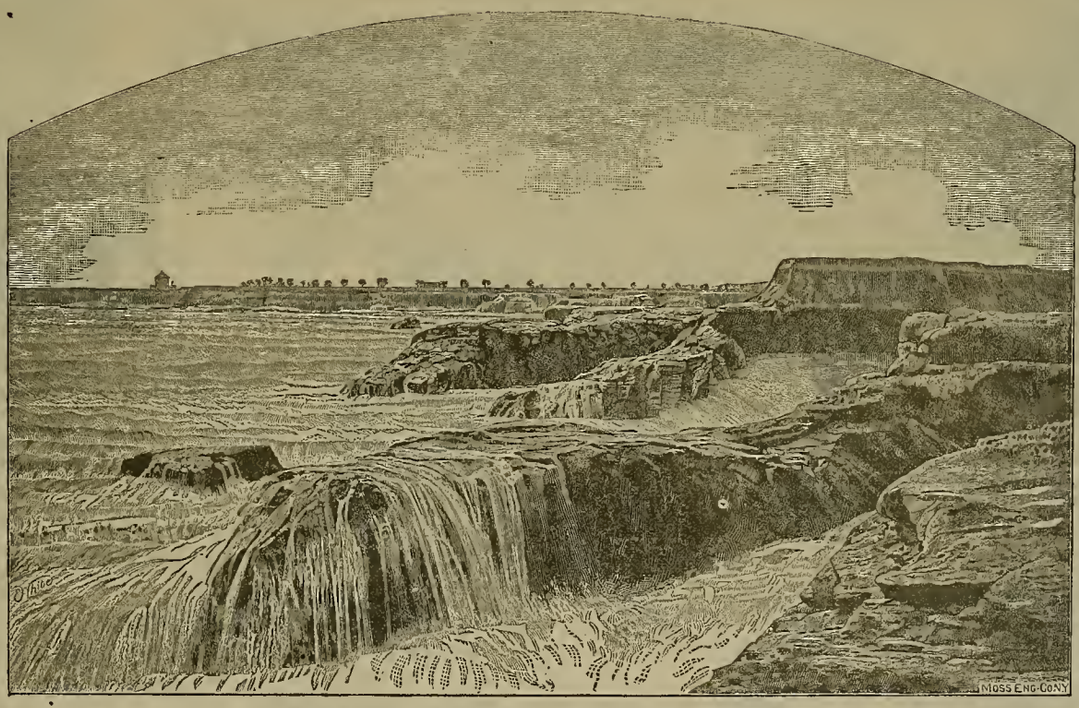
We give on this page hits of shore scenory near Santa Cruz, engraved from Watkins' photographs. They present ths aterner features of the coast line, for there are rocky points as well as smooth hsaches ln the neighborhood of Santa Cruz and Monterey, and those who viait these popular ssaside resorts can choos⁹ hetween plunging into a contemplation of the heautifnl in nature's rock-work or plunging it t› the rolling snrf, as pleases them hest. The natural hridge ia an interc›ting piece of wave soulpturing, not nncommon, however, on this coast. This nne is more noted than most hecause, perhaps, it is near a resort. Bnt works of this sortoceur in many places hetween San Diogo and Paget Sonnd. In our own hay we have Arch rock, and one of the Seal rocks near the Cliff House is cut throngh in the same manner hy the constant action of the waves.

The point of land which farms the northern and western point of Monterey hay, and near whioh Santa Crnz is huilt, is quite pictnesque as viewed from the sea. There are ontlying rocks from the main wall, as the engraving indicates, and over these the billows seethe and roar constantly. Nowhere along this stretch of the point on the seaward side can a landing he made; hut once inside the curve, the long sand beacb, whioh is one of the chief attractions of the town, begins. Here in snmmer are crowds of merry hathers, and all the sights so characteristio of a seaside resort. The town itself is qniet and old-fashioned. It is easily accessihle from San Francisco hy rail or steamer. Excursion tickets are sold by the Southern Pacific for this place or Monterey dnring the summer months at rednced rates, and during the school vacations hoth these towns are crowded with visitors.

The Santa Cruz and Monterey region is very interesting on many acconnts. It has scenes which charm the tourist who seeks historic sights and relios. It has grand fnrests near at hand and most beantifnl grovee. It is a land of flowers. Industrially the district is of great importance.



NATURAL BRIDGE ON THE COAST, NEAR SANTA CRUZ



SCENE ON THE SANTA CRUZ COAST, CALIFORNIA.

SOUTHERN CALIFORNIA ESTATES. — *Harper's Monthly* has the following paragraph on a California affair: The possessions of some of the great land owners of this section are prodigious. It is a favorite story that certain men are able to drive a herd of cattle from the northern counties of the State to San Diego, at its extreme southern limit, and quarter the animale every night upon their own territory. Haggin, Carr and Teivis, whose property I was privileged to examine considerably in detail, have some 400,000 acres. Much of this was secured for a mere trifle while in the condition of waste land and afterward redeemed. A neighbor, who had acquired a great estate of a similar kind, mainly while holding the post of Surveyor-General of the United States, drew forth one of the hest *bonmots* of President Lincoln. "Let me congratulate you," said Lincoln, as this gentleman was retiring from office under his administration. "You have become monarch of about all yon have surveyed."

THE new plans for the Channel tunnel have been issned, and are said to meet with the approval of the military critics. They bring the entrance and approach to the tunnel three miles inland, within the range of the defenses of the Dover garrison.

"PECULATIONS carried to extremes," is what Henry Clewes calls corners in grain.

Hoisting Appliances.

Prohahly the development of the mines on the Comstock lode has had the effect of further advancing the designs and types of mining machinery in this country than anything else. The conditions under which mining is carried on in the mines of that lode heing different from what we had before heen aconstomed to, necessitated different designs in the mechanical appliances. The mechanics of this city were compelled to overcome difficulties which presented themselves at each new step, and this has resulted in the perfection of machinery which is now being copied by manufacturers of this kind of work everywhere.

In hoisting appliances particularly great improvements have heen made. In Europe special attention is heing paid to improvements in this direction, and steady advances are heing made. At a recent meeting of an institute of mining and mechanical engineers in England, Mr. C. M. Perry, the well known mining engineer, expressed a helief that hefore long iron or inferior steel wire ropes for hoisting would give place to steel of highest quality, just as they had displaced hemp. He thinks also that flat and taper ropes will be aholished and round ones used exclusively. Another improvement, or at least an alteration, wonld he in the aholition of winding drums. These, however constructed, did not work the rope under the most favorable conditions. They either had the diameter constantly changing or else compelled a side movement which was injurious. They added to the first cost of the engines, and their weight and space necessitated a long and strong crank shaft and generated friction. He thought the Koepe system of winding would supersede others—that being the inventon of a German mining engineer.

Another direction in which he thought improvements would he made was in working steam expansively. At present a great many of their winding engines worked absolutely without expansion and discharged into the atmosphere twice in each revolution a cylinder full of steam that had practically done no work at all. The difficnlty had been this, that an engine for winding required to he equally powerful all through the stroke; therefore fixed expansion arrangements would not do. And the difficulty had heen met in the North hy the Grange Iron Co., who had applied their arrangements to perhaps the largest horizontal winding engines in England—namely, 48 in. diameter, at Silksworth, where ons pit raised 2,000 tons a day from a fair depth, and in the South hy the Oakside Iron Co., who had their appliance working some considerable time at a southern colliery and were now applying it in Lancashire. The general principles of these appliances agreed. They were both automatic expansion gear. When the cages were loading and unloading and decking, there was no expansion, and when the speed was hslow a certain point thers was no expansion; but in regular winding, after the first few strokes the expansion gear came automatically into operation and remained in operation till the speed slackened near the end of the winding—thus giving full power where needed, and where less power would do cutting off at a quarter or even earlier. It did seem not unreasonable to believe that winding appliances of the future would comprise some automatic expansion arrangements. Then, as regarded condensation, the early engines were condensing engines, and there were not a few condensing winding engines even now. But the tendency for many years had heen to make winding engines non-condensing; indeed, the usual condensing appliances attached to engines were hardly suited to winding, stopping when the engine stopped, and starting only when it started again.

Winding engines on an effective method of condensation wonld effect an enormous saving, and if, as would appear, they did not answer well working intermittently with qnick running engines they must adopt the separate condenser which has already heen introdnced and had met with a fair amonnt of snccess. A separate condenser working continnously and getting up an effective vacuum during the intervals of decking seemed the correct thing, and need be no incumbrance to any winding appliance, ae it might he arranged for the winding enginee to work with or without it. He was only expressing his own opinion when he said that winding appliances of the future would comprise at least three points: First, the Koepe system; second, automatic expansion gear; third, separate condensers. Having roughly endeavored, the lecturer observed, to cover the ground of winding appliances dating far hack, and looking somewhat ahead, he should not like to leave the subject without sugges ing that it was within the power of all of them in their day and generation to aim at something, if they did not accomplish it, that shonld tend to efficiency, safety and economy. Engineering and mining had always heen closely identified. The requirements of mining operations compelled the inventions and improvements of Savery, Newcomen and Watt.

Stephenson, to whom they owed so much for enabling them to dispose of their mineral wealth when obtained, commenced his most eminent career as a colliery engineer, much lower in position than any of them. With all the improvements that had heen invented, which had made the steam engine of inventiveness in the world's history, the rough diamonds that they raised day by day were still the food without which the steam engine could not exist. On the other hand, engineering had done much for them in their mining operations. It distributed the products of their labor over the length and breadth of the land, it pumped the water and made their mines workable, it raised their coals from the greatest depths, hauled them along their workings, and effected that ventilation lessening the danger and increasing the effectiveness. It was for those engaged in these operations throughout their lives to appreciate what had been accomplished, and to aim at accomplishing more.

HUMBOLDT county and the section surrounding is undergoing a hoom, as prospective railroads promise to give the world's market for its great timber resources. The cedar and redwood of that section are in demand in the East and in Europe, and there is a market all over the world for the pine, and the supply of oak bark for tanning is inadequate to the demand in San Francisco alone.

CHICAGO **FRASER & CHALMERS.** ILLINOIS

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LAROEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or squars. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittsnger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mins, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flangs Iron, or Otis Steel. Workmanship the most carcful. All Rivets Hand Driven.

HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin for Giant and Old Abe Co., Black Hills also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars. McCaskell's Patent Car Wheels and Axles—Best in Use.

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.

Carson and Colorado Railroad.

(NARROW-GAUGE.)

The Company announcee the completion of its line March 1, 1882, to CANDELARIA, Columbus Mining District, Esmeralda Co., Nev., 158 miles from Mound House (Junction with Virginia and Truckee Railroad).

STAGE CONNECTIONS,

At Hawthorne with U. S. Stage Company's daily coaches for Aurora (26 m.); Bodie (37 m.); Lundy and Bridgeport.

At Luning (125 miles from Mound House) with Gilmer, Salisbury & Co.'s tri-weekly stages (leaving Tuesday, Thursday and Saturday mornings) for Grantsville, Belmont and Tybo.

At Belleville (150 miles from Mound House) with Belleville and Independence Stage Co.'s stages for Benton (40 m.), Bishop Creek, Big Pine and Inuependence.

At Candelaria, with U. S. Stage Co.'s stages for Columbus (8 m.), Silver Peak, Montezuma, Alkda Valley, Gold Mountain, etc.

THROUGH TICKETS

To the above points for sale at San Francisco, Sacramento Reno, Carson and Virginia R. R. Ticket offices.

This is the direct and natural route for Passengers and Freight, to points in Southern Nevada, Mono and Inyo counties, California. The line, laid with steel rails and redwood ties and equipped with new and first-class rolling stock, is penetrating new and most promising Mining Districts which are now attracting deserved attention throughout the country.

For information on through freight rates apply to

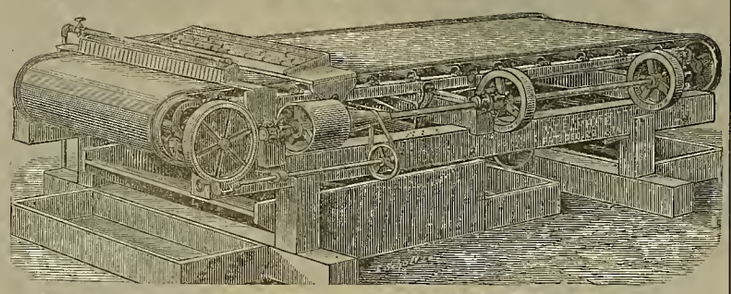
328 Bush St., bet. Montgomery & Kearny, up-stairs, S. F. Experimental machinery and all kinds of models, tin, copper and brass work.

$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR,

—OR—

VANNING MACHINE.

Over 400 are now in use, giving entire satisfaction. Saves from 40 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal.

A machine can be seen in working order, and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont Street.

To those intending to manufacture or purchase the so-called "Triumph" Concentrator, we herewith stete:

That legal advice has been given that *all shaking motion* applied to an *endless traveling* belt used for concentration of ores is an infringement on patents held and owned hy the Frue Vanning Machine Company.

That suit has been commenced in New York against an end-shake machine similar to the Triumph, and that as soon as decision is reached in the courts there, proceedings will be taken against all Western infringements.

That the patent laws make *users* of infringements responsible as well as makers, and the public is therefore warned that there is considerable risk in purchasing any end-shake machine until our various patents have been decided.

That if there are those who for any reason prefer an end-shake machine, we can manufacture and sell to such a machine of that description, as efficient as the Triumph, and at a lower price, and no liability for infringement will then be incurred by the purchaser.

That we shall protect ourselves against any one making, selling or using any machine infringing any of our patents. Patented July 9, 1867; May 4, 1869; Dec. 22, 1874; Sept. 2, 1879; April 27, 1880. Patents applied for.

That we are, and have been, ready at any time, to make a competitive trial against the Triumph, or any other machine, for stakes of $1,000.

269,449.—BALANCED STEAM VALVE—James O'Donnell, San Francisco.
269,327.—SHIRT—M. Salberg, S. F.
269,486.—ARTIFICIAL HORIZON—Thomas Tennent, S F.
269,364.—WASHING MACHINE—John D. Winters, Davisville, Cal.
269,494.—HARROW FRAME—James H. Winn, Benicia, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co. in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

ILLUMINATING BASEMENTS.—Peter H. Jackson, S. F., Cal. No. 269,292. Dated Dec. 19, 1882. This invention relates to certain improvements in illuminating basements, and consists in the combination of refraction lenses set in the sidewalk, basement extension or doorstep, with one or more reflecting mirrors, which are fixed or adjusted at the front so as to receive light from the lenses and reflect it backward into the cellar or basement. When basements or basement extensions are lighted by the ordinary lenses or illuminating tiles the light is thrown directly downward, and produces but little effect behind the line of the front wall of the building, so that long cellars or basements have no light in a great portion of their extent except that produced by artificial means. This defect in lighting has been partially overcome by the use of refracting lenses so set in the step or sidswalk as to refract the light backward into the cellar. The device is open to the objection that it is useless and even detrimental where beams, sills, water tables or wide bearing bars exist, and the inventor states that in such cases it is better to use plain lenses. For those lenses, which are fixed in the area covering, the mirror must be placed at the back of the sidewalk arches, and if lenses are placed in the sidewalk the mirrors should be fixed upon the bulkhead wall between the space under the sidewalk and the street. In all cases the mirrors must be placed at such a point as to receive the refracted rays of light which are thrown forward from the lenses and reflect them backward into the rear portion of the basement. The lenses are so graduated in the depth to which they extend below the plates in which they are set that the shortest will be the nearest to the mirrors, so that the light refracted from all may fall upon the mirror without obstruction.

TREADLE POWER.—John B. Kerr, Amador City, Cal. No. 269,294. Dated Dec. 19, 1882 The invention relates to a new and useful treadle power, and consists in a suspended vibrating treadle or treadles, in connection with means for transmitting the motion to a driving mechanism, either directly or through the intervention of a rocking shaft. The object is to provide a light-running treadle power, simple in construction and economical. The advantages derived from the various spring connections are first, a saving of lost motion, and second, noiselessness. When the limit of the stroke of the treadle or arms is reached the resistance which the springs oppose serves to start and assist the return stroke, and the entire device is thereby made to work easier than if the parts were merely pivoted. Not being pivoted, there is no noise from the movement upon journals. The firm connections allow its silent operation, while the springs themselves provide for the yield or play of the oscillating parts. The horizontal reciprocating motion, by which this device is operated, is not as injurious as the vertical-hinged movement of the ordinary sewing machine treadle, and it may be worked with less power.

SHIRT.—Moses Salberg, S. F., Cal., assignor of one-half to Julius Levy, of same place. No. 269,327. Dated Dec. 19, 1882. This invention relates to an improvement in shirts, consisting mainly in a collar-band, which is made with an extension to overlap in the back and fasten at one side of the middle, the extension having also a hole to receive the back collar stud, which is prevented from touching the neck by the inner end of the collar-band, which is not perforated, but simply lies beneath the inner head of the collar button.

CONCRETE ARCH FOR SIDEWALKS AND OVER AREAS.—Geo. Goodman, S. F., Cal. No. 269,280. Dated Dec. 19, 1882. The invention relates to the construction of the arches, and also to the construction of the joints between the ends of a series of arches, and also between the ends of single arches and the abutments, of whatever kind they may be, against which the arches may rest. Most plastic material of which concrete and artificial stone arches are made will, in course of time, shrink to a slight extent, and thereby often open the perpendicular joints at the ends of the arches sufficiently to allow water to leak through the joints into the room below. The principal object of the invention is to remedy this evil.

WASHING MACHINE.—John D. Winters, Davisville, Yolo county, Cal. No. 269,364. Dated Dec. 19, 1882. The invention relates to certain improvements in washing machines, which are also applicable to churns, consisting in certain details of construction and arrangement. Within the body are transverse bars or corrugations, and wooden balls roll from end to end as the body is rocked, to facilitate the work. Beneath the body is a shelf, upon which a lamp or heater may be supported to regulate the temperature in churning.

WATER RAISING DEVICE.—Charles K. Kirby, S. F., Cal. No. 269,295. Dated Dec. 19, 1882. This invention relates to an apparatus for raising water either vertically or upon inclines, and consists in certain details of construction. It is really a water elevator, consisting of a series of pairs of buckets, arranged on opposite sides of a drive-chain, and supported by and loosely pivoted to arms projecting from the sides of links within said drive-chain, combined with sprocket wheels and a tipping device.

BOILER.—Joseph R. Mitchell and Frank X. Fischer, S. F., Cal. No. 269,308. Dated Dec. 19, 1882. This invention relates to certain improvements in engine boilers, and consists in certain details of construction for strengthening and improving the boiler.

THE HARMON SEMINARY.—A musicale, closing the half year, was given at the Harmon Seminary on Wednesday evening, the 20th inst., which, like all entertainments at that institution, was marked by much taste, and elegant in its appointments. The programme was made up of performances, instrumental and vocal, by the pupils—which were in the highest degree creditable to them, to their instructors and to the liberal management of the principals—varied and enriched by pieces from Prof. Toepke, Prof. Zech, the Misses Harmon and Miss Knapp. Whilst the performances of these last named were all of distinguished merit and greatly delighted the intelligent audience, it is allowable, for the encouragement of so young a debutante, to say that the rendering of the cavatina from "Semiramis," by Miss Sophie Harmon, was of rare excellence, and its enjoyment was manifested by her enthusiastic recall to the rostrum. The seminary has had a successful first term, and an increased attendance is expected for the next, which will bsgin January 11th.—*Oakland Tribune.*

REPAIRING.—The usual annual overhauling of machinery and appartus is about to be commenced at the C. and C. shaft. They will thoroughly repair all the surface macbinery and overhaul all the pumps and other apparatus from the top to the bottom of the shaft. While this is being done, the miners who now reach the lower levels through the C. and C. will go down by way of the Union shaft. This annual overhauling is generally done during the holidays. When the machinery has been put in order at the C. and C., the pumping apparatus at the Union shaft will be changed, and while the work is in progress the men will all reach the lower levels through the C. and C. shaft. Prospecting operations will not be interrupted at any point. At the Ophir all the machinery, both on the surface and underground, is in excellent order, all repairs having been completed.—*Enterprise.*

A PURE strengthening tonic, free from whisky and alcohol, cures dyspepsia and similar diseases. It has never been equalled. Brown's Iron Bitters.

IN the Stassfurt salt mines the potash beds are now worked out completely, and the space filled with rock instead of leaving pillars as formerly.

CHEAP ORE PULVERIZER.—There is for sale in this city, as will be seen by our advertising columns, a second-hand Rutherford Pulverizer, which was only used a few times and is as good as new. It will be sold very much below cost, and miners who are in need of such an appliance for a small mine will do well to make inquiries concerning it.

Old Papers Wanted.

Twenty cents each will be paid for a limited number of copies of any of the following Nos. of the MINING AND SCIENTIFIC PRESS, if received soon at this office: No. 1, of Vol. 13, 1866; No 5, Vol. 18, 1869; Nos. 1 and 26, of Vol. 20, 1870; No. 1, of Vol. 22, 1871. Also, 10 cents per copy for Nos. 2, 3, 4, 7, 10, 11, 12, 13 and 15, of Vol. 30, 1875. If any one who has files of back volumes of the PRESS, which they may like to dispose of at a moderate rate, will send us a memorandum of the same and the price, we may be able, sooner or later, to assist in their disposal.

STRONG FACTS!

A great many people are asking what particular troubles BROWN'S IRON BITTERS is good for.

It will cure Heart Disease, Paralysis, Dropsy, Kidney Disease, Consumption, Dyspepsia, Rheumatism, Neuralgia, and all similar diseases.

Its wonderful curative power is simply because it purifies and enriches the blood, thus beginning at the foundation, and by building up the system, drives out all disease.

A Lady Cured of Rheumatism.

Baltimore, Md., May 7, 1880.
My health was much shattered by Rheumatism when I commenced taking Brown's Iron Bitters, and I scarcely had strength enough to attend to my daily household duties. I am now using the third bottle and I am regaining strength daily, and I cheerfully recommend it to all.
I cannot say too much in praise of it. Mrs. MARY E. BRASHEAR, 173 Prestmanst.

Kidney Disease Cured.

Christiansburg, Va., 1881.
Suffering from kidney disease, from which I could get no relief, I tried Brown's Iron Bitters, which cured me completely. A child of mine, recovering from scarlet fever, had no appetite and did not seem to be able to eat at all. I gave him Iron Bitters with the happiest results.
J. KYLE MONTAGUE.

Heart Disease.

Vine St., Harrisburg, Pa.
Dec. 2, 1881.
After trying different physicians and many remedies for palpitation of the heart without receiving any benefit, I was advised to try Brown's Iron Bitters. I have used two bottles and never found anything that gave me so much relief.
Mrs. JENNIE HESS.

For the peculiar troubles to which ladies are subject, BROWN'S IRON BITTERS is invaluable. Try it.

Be sure and get the Genuine.

THE HARMON SEMINARY,

Berkeley, Cal.

A FIRST-CLASS BOARDING SCHOOL FOR YOUNG LADIES.

It is not second to any school for young ladies in the State. The building is new and perfect in its arrangements for health and comfort. The situation is admirable, and commands a view of sea and mountain that I have not found surpassed on the Continent.—*Rev. R. L. Breck, D. D., in the Occident.*

Next Term will begin Thursday, Jan. 11, '83

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the eir at eny speed or pressure. The heating of the air entirely prevented at eny pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best edventege. Access obtaineble to all the velves by removing air chost covers. Entire absence of springs or friction to open or shut the valves. No valve stems to breek and drop inside of cylinders.

Have no back or front heads to break. The only Machine thet makes e perfect diagrem. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

MINING MACHINERY A SPECIALTY.

Our manufactures of mining machinery embrace every kind of machine and appliance for the mining and reduction of ores.

We have had an experience of more than twenty years in the manufacture and practical operation of mining machinery in Colorado and the neighboring States and Territories.

Our facilities are superior to those of any manufactory in the West, our works having been recently rebuilt, greatly enlarged and completely equipped.

We invite the investigation of mine owners and mill men seeking machinery. We can furnish, on board, at our works, or set up at the mines anywhere in the Rocky Mountain region, on short notice, the following machinery: Cornish Pumps, Steam Pumps, Stamp Mills for Wet or Dry crushing, Pans, Settlers, Agitators, Retorts, Bullion and Ingot Moulds, Reverberatory Furnaces, Bruckner Cylinders, Revolving Roasting Furnaces and Dryers, Melting Furnaces, Concentrating Machinery, Rolls, Crushers, Conveyors and Elevators, Ore Samplers and Grinders, Hoisting Engines, Water Jacket Furnaces, Slag Pots and Cars, Lead Pots and Ladles, Blast Pipes and Water Tuyeres, Blowers, Cupellation Furnaces, Market Kettles, Wire Rope, Cages, Buckets, Skips, Ore Cars, etc. Estimates furnished and prices quoted on application. Send for illustrated catalogue.

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

— BY USING —

SILVER PLATED AMALGAMATING PLATES.

The most economical and successful process now in use. Will warrant my Plates to save more gold than any other method, and double the amount of the same surface of ordinary copper plates. The only plates that have proved durable and satisfactory.

OLD MINING PLATES BOUGHT, TAKEN IN EXCHANGE FOR NEW, OR RE-PLATED.

ALL KINDS OF METAL GOODS PLATED!

San Francisco Gold, Silver and Nickel Plating Works,

653 and 655 Mission St., bet. New Montgomery and Third, San Francisco.

Send for Circular. EDWARD G. DENNISTON, PROPRIETOR.

Awarded the First Premium at every Fair of the Mechanics' Institute for the last 12 Years.

L. C. MARSHUTZ. T. C. CANTRELL

National Iron Works,

Northwest Cor. Main and Howard Sts., San Francisco,

MANUFACTURERS OF

IMPROVED PORTABLE HOISTING ENGINES

At Greatly Reduced Prices.

HOME INDUSTRY! ALL WORK TESTED AND GUARANTEED!

Stationary and Compound Engines, Flour, Sugar, Quartz and Saw Mills. Amalgamating Machines.

CASTINGS AND FORGINGS OF EVERY DESCRIPTION.

Sole Manufacturers of Kendall's Patent Quartz Mills.

READY FOR DELIVERY.

LATHES, DRILLING MACHINES, PLANING MACHINES

and Other Machine Tools,

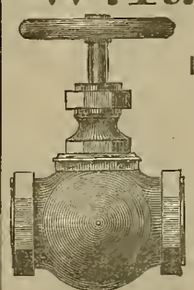
STRONG, DURABLE AND SUPERIOR TO IMPORTED MACHINES.

Wheel Cutting to Order.

SAN FRANCISCO TOOL CO., - - **21 Stevenson St., S. F.**

W. R. ALLEN & CO.,

IMPORTERS OF



Iron Pipe and Fittings,

Lift and Force Pumps,

Brass Cocks and Valves,

For Steam, Water and Gas,

Sheet Zinc, Iron Sinks,

Plumbers' Goods.

Nos. 327 and 329 Market Street, Cor. Fremont, S. F.

INDEX TO VOLUME XLV

—OF THE—

Mining and Scientific Press.

From July, 1882, to January, 1883.
